Pvfork() is still blocking, and that cannot change. It is the Pfork()
that was made non-blocking.

Except in Linux, where we have clone(2). This makes it possible to
implement kernel based POSIX threads.

I thought that the later free-MiNT releases had changed this... maybe
not... (just a vague memory...)

3404. GCC for MiNT: latest versions?

Newsgroup: comp.sys.atari.programmer
Date: 1996-10-30 00:00:00 UTC
From: "Jens M. Felderhoff" <jmf@informatik.uni-koblenz.de>
Message-ID: <32776BC8.E2C@informatik.uni-koblenz.de>
Source record: 8747

Recently I downloaded the 2.6.3 version of gcc/g++
for MiNT. However, the linker was not included,
and the old linker searches for xxx.olb files
rather than libxxx.a.

It's obvious that I need another linker, but where
do I get it.

BTW: My old one is from about 1993.

No, MiNT does not support threads. Some people call it threads, but
in fact these are parallel processes. "Threads" always means _ONE_
process for more than one task. MagiC supports threads, MAGXDESK uses
threads.

> what I have...

Yes, it tells if the song is mono, but it's a little frustrating if you have a slow connection and download large files which you can't play.

Anyhow, you would definitely notice that something was wrong if it would play a mono song. :)

> Anyway, it looks like it doesn't work on the Afterburner040. I get the
> countdown (I guess it's the length of the song) and it counts
> down, so it looks like it's doing something, but I get no sound.

This is a problem with the devconnects we use. Earlier we used the c bindings to do the devconnects. Then it didn't work in MiNT. Now, it's done by three assembler lines. (could in fact be made in two!)

Sometimes, this occurs but works if you press stop and the play again.

I'm not really sure why this happens, but the communication isn't really meant to be used the way we do and by some reason, the handshake communication from DMA to DSP doesn't work. By restarting the song, the DSP program is uploaded to the DSP again, and it might work.

3407. Eureka a graph describer and 3D modeler

Newsgroup: comp.sys.atari.programmer
Date: 1996-10-30 00:00:00 UTC
From: lecoat@chronos.ief-paris-sud.fr
Message-ID: <557sma$hqm@upsn6.u-psud.fr>
Source record: 8750

Hello everybody,

I'm a french developper working on a program called Eureka 2.12.
It's a 2D numerical analysis program, and a 3D modelling of
mathematical shapes. It also includes 4D presentation, because
a time parameter is available. It's quite easy to make movies
showing the evolution of a formula in 3D rotating, morphing from
a shape to another etc... Data files can be loaded so that you can
manipulate series, or even stereo/mono sample files manipulating
sounds. Images can be produced, computing them with formulas to
draw fractals such as Julia or Madelbrot sets. You can even map
these images on a 3D surface, producing impressive representations.
Since the last revision of my program it is now in two languages
French and English. The english translation of the documentation
will be soon available. My goal is to make a program like some
on other platform such as Mathematica or Matlab.
My work is a complete package including the program and some
accessory like a snapshot, an unusual recording accessory that
allow you to demonstrate the program like a mecanical piano would
play Stravinsky (?). There's a program that can show your movies
etc ...
The latest english version is available on my home page at :
http://www.ief.u-psud.fr/~lecoat/
That page is mainly illustrated with my program so that you can
see what is possible to do. Eureka has 3D2 Raw and VRML exports
so you will see Virtual reality demonstrations of objects, and
movies or images produced with Persistence Of Vision.
The latest revision will also be available soon by FTP on the
"Conservatoire National des Arts et Metiers" at :
ftp://ftp.cnam.fr/pub/Atari/Applications
Anyway for any problem report in my mailbox at :
lecoat@ief.u-psud.fr
Any suggestions are also welcomed ...
Have fun with my production, bye for now ...

Um, MiNT has supported threads for quite a while now -- at least the
tfork() library routine has been around since I got involved with it.
The problem is that the MiNT library itself isn't thread-safe, so two
threads could hit the same internal library data structure
simultaneously and screw each other up.

Ofcourse we will buy it if it's any good. Why not?
We realy need some _good_ games to get some life back in the games
market on the Atari. We have great graphics programs, wp's and other
cool stuff like CAB for the Atari, but we still lack some cool games.

Go for it!

BTW. $20 sounds cheap for Duke3D on the Falcon. ;-)

Hello. I am looking for a copy of PC Xformer 3.2 for DOS...does anyone know where I might be able to find one? I would also be interested in any 8-bit Atari emulators for DOS I might be able to FTP from the Net... I have an 800XL, and would like to program it using assembly. Is there a place on the Net, or does anyone know of a good book, which would teach me 6502 assembly? Kinda cool fact: the Apple IIe has a 6502, and SO DOES MY ATARI! :) I really would appreciate any help on these two topics. If you can help me, please e-mail me as I am not able to read usenet news. Thanx!

BTW - Do you know how to copy cartridges to disk? Thanx again!

I remember playing around with some way to run a function as a thread
by itself under MiNT while the rest of the program continued.
That was several years ago.

I think the MiNT call I used wasn't really documented at the time, but it
sure worked.
Looking through the include files, I can find tfork() which looks like what
I remember. It still doesn't seem to be documented, though.

>The problem is that the MiNT library itself isn't thread-safe, so two

I guess that might be a good reason not to document things. ;-)
Still, why hasn't anything been done about that yet? Surely it can't be
that difficult to make the library reentrant or use semaphore blocking?

Well, I'm not sure this is the problem, but I will give it a try.
Do you know if someone else have managed to ge it working on the
Afterburner040? The previous version (0.5?) did not.

This in under TOS 4.04 on a AB040 Falcon.

BTW. Is it supposed to work under MagiC?

3419. AES 4.1 Documentation

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-01 00:00:00 UTC
From: Dale Philip Needham <needhadp@eng.derby.ac.uk>
Message-ID: <3279EB00.59F4@eng.derby.ac.uk>
Source record: 8762

Hello
I own a falcon030 and lattacie C5.6, normally I run AES4.0 which
came with multitos. However I have found that Geneva 4 supports most if
not all the features of AES 4.1, i.e. iconify etc. Looking in the aes.h
file from lattice C I have found that it to supports aes 4.1, the
documentation (printed & on disk) makes no mention of these functions.

i.e.
messages : WM_ICONIFY, WM_UNICONIFY, WM_ALLICONIFY

etc.

I have got the iconify routines to work but haven't got a clue what all
the parameters DO.... so far I just give them the window handle and
hope.

I have written to Hi-Soft twice and both times all questions relating to
these problems have been ignored while other parts of the letters have
been answered. Thus any help would be very helpful.

Also does anyone know if the NVDI programmers guide has an english
version anywhere?

Thank you

Dale Needham

The Atari Compendium is probably the best source for info about AES
versions up to 4.1 (as well as every other GEMDOS/BIOS/XBIOS/VDI call).
You can get it in book or CD form from Toad and probably other
distributors as well.

Geneva does support all of the AES 4.0-specific stuff, and most of the 4.1
things. You can use appl_getinfo() to find out if a particular call is
available.

That sound odd -- I would have thought that they would have tried to sell the
Atari Compendium to you -- it's about the best programming manual for the
Atari full stop, covering AES4.1 (and above...) as well as GEMDOS, VDI, MiNT,
BIOS and XBIOS stuff.

If you have a Falcon, then get Modern Atari Systems Software (also from
HiSoft) which covers Falcon specific stuff, as well as AES4 (not sure about
4.1, but prolly) and MiNT.

MAC-MiNT started as an attempt to get a GCC programming environment on the MAC.

Noew there are Virtual Memory versions available.

It should be possible to get up GCC on the MAC to compile Atari programs,
but since you have a falcon, why not use it instead.

Hmm, If it didn't work with that version, it's not very likely it will
work with the new version, 0.7.

The old, 0.5, used host transfer for data to the DSP.

> This in under TOS 4.04 on a AB040 Falcon.

It should, but I haven't tried. It works under oAESis and N.AES.

Erm, not sure but I saw a 200K doc entitled "NVDI" in a recent back
issue (36 iirc) of ICATARI whilst browsing. I only looked at the first
few lines before I lost it but it was in english and is probably what
you are both looking for. :-)

As far as I know, there is no standard format for YM2149 music. There
are plenty of music files by different authors. Mostly "Mad Max".

Trackers: Plenty of them.. Mostly 4Channel @ 10Khz for the
STFM/STF/STM. On an STE+ stereo and up to 50Khz playback rate. Most handle
"Amiga" Mod format.

Check PD libraries/Net sites for some.

Cheers,

: Hi folks! I'm in the process of setting up a shareware company
: called Atlantis Software Development. After perusing the computer
: market as it stands now, I've been convinced that the two markets that
: need attention are the Amiga and Atari markets. I've ruled out
: programming for the PC and Mac's because those markets are already
: crowded. What I am basically wondering is if there are still folks
: that would buy video games for Atari computers, like Duke3D stuff,
: and what they think is a fair price. I suggest a price of $20 for
: the registered versions of the games. Of course, the shareware
: "taster" is completely free. Within the next month I will be
: establishing
: a permanent Web page and Email address (right now I am using a student
: account). For the moment you can write me at bitbrker@ipa.net with
: suggestions and comments for the types of games you would like to see
: and which Atari platforms you would like to see it on. The initial
: Atari computer to be supported will be the Falcon, of source. But, I
: am willing to support any Atari platform that can handle 256 color
: displays and has at least a 68030 CPU. Let me know what you think!
: I hope that you will be pleased to know that I am here to serve you
: with great software for your Atari computer. I am not a fly-by-night
: programmer, nor am I interested only in making the most money that I
: can as a video game programmer. As long as there is demand for Atari
: software, I'll be here to make it for you. In the mean time, I'll be
: working on some games for the Falcon and Amiga systems.
:
: Your friend, Terry Miller 2, Atlantis Software Development

: P.S. Anyone who knows where I can get any interesting programming
: documentation for the Atari computers, please let me know.
: I am always anxious to add to my library! ;)

Duke 3d on Falcon? har, har! This project will probably never appear on
a screen! I don't like people who say such bullshit... Look at your company
name: Atlantis... A fiction, like your projects!

The Bad Mood graphics engine is available for anyone who wants to
put together a game of this type. Doom itself (the Id version) has
been ported to the falcon (I saw it running at the London Atari Show).
So these things are quite possible.

So stick it up your arse Mr Wolf. If folks want to work on things, and
and think they can do it, who are you to be so negative.

Hi, There are 2 little program I would like to have. And I was out of
luck to find one of them.
1 would be a small accessory that would play MID files. I know that
theres a lot of atari users who have a sound expander or at least a
synthesiser. The atari was/is the midi machine. And if CAB could use
it as a MID player it would be cool too..
2 would be a little auto program that emulates the controle key when
we press the right mouse button. Like this we could move files only
using the mouse. This would only be enable when we are on the desktop,
since some program use the right mouse button.
I think it's unfortunate that we can not use the right mouse button
on the desktop..
That was just some thoughts, thanks .. bye..

>So these things are quite possible.

1) Being possible and actually happening are two very different things,
2) DOOM and Bad Mood (the latter is not a game at the moment) are hardly comparable to Duke3d, not in your wildest dreams,
3) I would agree, Duke3d Wont appear on an ATARI

But the guy although making a valid point, seems to have put it in a rather nasty way, Insulting in fact,

But (again) I can see his point, someone pops along and says Hey! everyone, I think I will make Duke3d for your ATARI, aren't I nice, or words to that effect,well it sorta makes all the people who have been trying for years to make a Doom clone look inept? and thats not very nice,
NO ONE has yet made a decent Doom clone for the ATARI Computer, Substation was a brave attempt, DESTRUCTION IMMINENT is a great game released at the ATARI show in Birmingham, better than Substation IMHO and I am a beta tester for KILLTHING that IMHO kicks them all and will work on anything from an FM,
But none of them come anywhere near Doom or indeed the subject? Duke3D

The guy made a valid point, he just made it badly and insultingly in OUR? opinion,

>So stick it up your arse Mr Wolf. If folks want to work on things, and

Ho dear...havn't you just done exactly what you are complaining he did?

>and think they can do it, who are you to be so negative.

Exactly, anyone want to give it a shot then go for it, if its a valid attempt then we will all support there efforts, I would be in Awe and indeed am at the efforts already made..if only I..nagh:)

Just my opinions :)

PS, Wheres the original poster now? working away on a Duke3D clone for
the ATARI....I think not?

Cheers.............!ynoT

>threads.

That distinction is really meaningless. The significant feature of threads
that makes them more useful than multiple processes is that they all share
a single data space. In that respect, MiNT "threads" are genuine threads.
The only notable difference is that instead of the added overhead of a
threads-scheduler running on top of the Unix process scheduler, you only
have a single MiNT process scheduler. As such, threads in MiNT can execute
more efficiently than user or kernel threads in Unix.

As has already been pointed out, there's no problem with the kernel
functionality, all that's missing is a library that supports a thread-oriented
API. The source code for POSIX-compliant pthreads library is freely available;
I believe that's where Linux's threads library came from. Anyone with some
time could port to MiNT with minimal headaches.

I'd like to see a really cool virtual war game for the Falcon...
Something based on fairly current global situations...perhaps offering
portable data so that current geography can be updated and changed.
Toss in as much as possible...politics...stratagy...spy
networks...nuclear...conventional...weather...economy/production...
I guess you'd call it a "God Game"?

Also...I'd really like to see a statistic based Base Ball game...like
Persue the penate. Better yet...a Rotissary version that'll work over the
internet! Here...you might want to make versions for all platforms with
platform independent data for exchange.

Graphics are cool...but I really miss game that are simply addictive and
very playable! Smart, data intensive games would be a nice thing.

Brian

I'd like to see someone put together a nice set of tools for
making web-pages.

The main tool I'd like to see is a simple little program that will
load and display jpegs and gifs so you can rubberband various areas
of the image and create image maps...both client side and CIS script
formats.

Something else that would be really neat...
A program that can take Page Stream, Calamus, Post Script, Papyrus, etc...
documents and convert them to HTML. Next it should allow you to pick
text and images with your mouse and imbed your links.

Brian

3440. MiNT threads - Pfork() ???

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-06 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <b67cc$172735.135@HERMES>
Source record: 8783

According to what I read in the Compendium, I believe the correct way of implementing GEM threads is:

```
int main( int argc, char *argv{} )
{
ap_id = appl_init();
do_something();
if( user_wants_feature_X ) {
pid = Pfork();
if( pid == 0 ) {
ap = appl_init();
form_alert( 1, "[1][Feature X][ ok ]" );
feature_X();
appl_exit();
Pterm( 0 );
}
}
clean_up();
appl_exit();
return code;
}
```

But this seems to fail. Both the parent and the child thread seem to be asleep.

Where is it wrong?

(I am using MiNT 1.14 on a 20 Mbyte TT (4+16) with about 12 megs of free ram (about 11 of them in fast ram) with AES 4.1. My compiler is Lattice C 5.60, and it is configured as 32-bit integers, near data, stack passing).

3444. comp.sys.atari.st?

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-06 00:00:00 UTC
From: jdaddin9@airmail.net
Message-ID: <55qqf2$c7a@library.airnews.net>
Source record: 8787

Has anyone had trouble getting onto comp.sys.atari.st? Yesterday, the group suddenly disappeared from the 2 providers lists that I have access to. I can't even seem to get new messages via the Dejanews web newsreader.

-Jared

3445. HELP!!!

Both run on the Falcon just fine, albeit a little fast. All you have to do (on some systems) is hold down an [alt] [control] combo (I'm not sure what order...) While on others, like mine it boots up fine with nothing having to be done at all. I've also heard of intermittent "crashing" on some Falcons...seems to vary a little from machine to machine. If you are using ICD's utils, read in the manual about how to force a floppy drive boot-up...(about the crashing-just save your game a lot! But then, like all good dungeoneers, I'm sure you do that anyways, right?!) :)

You should be able to download them from umich or toad. (I'm not
sure which ftp sites carry it. I only uploaded it to Genie and
Fidonet.) The names are ELF_HELP.ZIP and ELF_HLP2.ZIP (upgrade).

Or you can send the $20 shareware fee to E.L.F. Software, 9614
Oregano, Houston TX 77036 ($5 extra for non-USA personal checks),
and I'll send a registered copy via Snail mail.

BTW, I'm running out of DD floppies. Can you handle HD?

I think you are wrong here. On the desktop you can use the right mous button to select items in not selected windows. I regulary to doubleclick on an archive so it will be depacked in the slewted window. (I have installed al packer programs so a dubble click on an archive will depack the archive in the current (=selected) directory.

Yeah, or a SIMCITY (2000) clone. That would be just great! It would also run
under GEM so you can use it under a Multitasking system like MagiC in
16 colours and enhanced graphics in 256 colours (maybe even 2 if possible).
This would also make it compatible on all TOS computers, not only Falcon.

So what do you say? :-)

3457. TT030 for sale

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-08 00:00:00 UTC
From: mvrbicky@edu.uni-klu.ac.at
Message-ID: <328314C4.3EB5@edu.uni-klu.ac.at>
Source record: 8700

I have an Atari TT030 for sale.

Includes:
- 8 Mb internal memory (4 Mb ST-RAM / 4 Mb TT-RAM).
- 200 Mb SCSI harddisk.
- 1.44 Mb floppy disk drive.
- Crazy Dots II VME graphiccard (1024x768, 256 colors, 76Hz,
800x600, 65536 colors ...)
Works with every SVGA monitor.
- Installed Linux 68k (1.2.13pl10) with X11R6 (1024x768)
I have connected my TT via a serial line to my PC and it works great
as an X Terminal.
- About 200 diskettes with Atari software, lots of original software
incl. handbooks.
- And more.

All in one sale.
Price: ATS 8000,- (DM 1150,- US$ 800,-),
(bases for negotiation)

It also doesn't support shel_write() in mode 0, which means that you
cannot ask the OS to launch a program concurrently from within your own
program - except via the AV-Protocol but that relys on a having a decent
AV server installed - which MagXDesk aint!

It beats me why 2B go for this "almost there" solution of AES 3.99
rather than implementing it properly. When I first got MagiC 4,System
Solutions told me that they had passed a number of complaints onto 2B
about this but nothing changed for v5.

Regards
Martyn

3459. Need info on CTX-fileformat

Hello..

For a projekt I need to know the format of the Calamus textfiles.
As Calamus win95 cannot convert this files safely, I have to
do it myself.
Could anybody who knows the CTX fileformat send me this
information? I would appreciate any help.
The problem is I need to get the text out depending on the
layout, meaning I need to know how Calamus saves it.
If someone has documents or help files about it, please send
it. It can be in English, German or Dutch ;-) .

Thanks in advance,

Greetings, Erik

Any time your favorite newsgroup disappears, you should send mail to your news admin. Karsten, yours is newsadmin@cl-ki.uni-osnabrueck.de; you might want to notify postmaster@cl-ki.uni-osnabrueck.de also.

comp.sys.atari.st was rmgrouped by a rogue site attempting to disrupt Usenet. Your news admin should not accept "Big 8" newgroup or rmgroup messages without a valid PGP signature from tale.

Yes, it does, thought to be honest with you, I never tested them with
anything but the basic test program that Atari sent to developers with the
AES 4.1 alpha.

Geneva completely supports all the flavors of shel_write(), including mode 0.

The best (And only) is Gnu C++, you can find it on most ftp-sites.
Perhaps the best site for MiNT and atari-specific Gnu-stuff is
ftp.fu-berlin.de.

Let's not get too depressed here. MagiC is very good, but "power users"
are IMHO better off with N.AES. It's fast and stable, and you also get
to use all the goodies with MiNT.

But for everybody else who probably just want to multitask GEM-programs
MagiC is still the best choice. It's easier to maintain and generally
requires less memory and CPU.

> feature_X();
> appl_exit();
> Pterm( 0 );
> }
```

No, this is one of the places where the Compendium got it wrong.
The correct way to do threads under MiNT is to create a new basepage,
then launch it with the Pexec "just go" mode (sorry, I can't remember
the numbers off hand). The MiNT library has a function, tfork(),
which will do all this for you. The code sequence above would then
look something like:

```
pid = tfork(run_feature_X, 0);
```

where run_feature_X was defined like:

```
void run_feature_X()
{
ap = appl_init();
form_alert( 1, "[1][Feature X][ ok ]" );
feature_X();
appl_exit();
}
```

The tfork() call launches a given function in a separate thread.
When the function returns, the thread is automatically terminated.
Note that the standard C library is *not* re-entrant, so the
thread must be very careful about the library calls it makes! (Indeed,
I'm not certain my example above will work; it probably depends on
how the library implements form_alert, appl_init, and so on).

Here's the "meow bomb" FAQ:

FROM: trebor@sirius.com
SUBJECT: INSTA-FAQ: For you to answer hate mail you might get about the binary flood
DATE: Sat, 02 Nov 1996 21:58:05 -0800 ORGANIZATION: Sirius Connections
MESSAGE-ID: <328833b1.6056085@news.sirius.com> NEWSGROUPS: news.admin.net-abuse.misc

Here's an short FAQ I've created, while trying to keep my mailbox from being destroyed by auto-responder acknowledgements.

INSTA-FAQ: What's with all this shit in my favorite newsgroup?
==========
I've created this INSTA-FAQ [tm, I guess] for those who have not yet learned to read Usenet headers, and who wonder WTF is up with this flooding. Please read it before taking any action about the flood.

What's going on?
==========
Easy! A gang of dysfunctional adolescents finds it hysterically funny to post a large file to a whole bunch of groups, putting the email address of a whole bunch of people in the Reply-To: line of the post. They hope to generate a lot of hate mail to those people.

They also include as many test newsgroups as they can in the flood. Since every post to a test newsgroup generates about a dozen acknowledgements from auto-responders around the world, they hope that this will create a mailbomb for the people in the Reply-To: line.

5,000 posts X 10 test newsgroups X 10 auto-responders = 500,000 responses!

Fortunately, and because they've tried this before, most people are prepared for this, and the mailbombs just don't materialize. Most people realize what's going on, and don't send hate mail to the innocent victims, either.

Who are these Idiots[tm]?
==========
In real life? I dunno... On the Net, they are just a bunch of little boys who

haven't grown up, and who go around calling themselves 'The Meowers.'

If they don't engage in real vandalism, like spraying graffiti, or ganging up on elderly people sunning themselves in the park, it's because they're not brave enough.

They have all the guts of someone tossing eggs from a moving car.

What should we do?
==========
Right now? Nothing. Grin and bear it. Hey, at least you're not one of the people being mailbombed!

DO NOT SEND EMAIL TO THE PEOPLE IN THE REPLY-TO LINE!!!!

It's not them towards whom your anger should be directed.

If you want to do something, learn about Usenet and reading headers.

If you want to do something, oppose the Meowers and what they do. They have destroyed many, many newsgroups, and who knows when it will be your turn, or your favorite newsgroup's turn, to be harassed by them.

This is a lie.
MagiC's mode 0 is TOS-compatible what means that MutliTOS is not TOS-compatible.
To start programs concurrently there is another shel_write() mode which does not conflict with TOS.
One can ask which behaviour the system has by calling appl_getinfo(). This call tells you if the system is TOS compatible or MultiTOS compatible.

Another way to launch programs concurrently is Pexec(100). But if you think that you need AV to start a program you most probably never heard of Pexec.

: It beats me why 2B go for this "almost there" solution of AES 3.99
: rather than implementing it properly. When I first got MagiC 4,System
: Solutions told me that they had passed a number of complaints onto 2B
: about this but nothing changed for v5.

All shells use MagiC shel_write-Calls for starting programs. Changing this would cause incompatibilities with former MagiC versions and with TOS.

Instead of complaining about version 3.99 tell us how to start programs in MultiTOS using the single tasking mode.
There is none?
So use tool bars instead.

m > I am also interested about actual state of PureC. If 2.0 do
m > not come out, is it a matter of copyright ?

Sort of. Pure C was developed under license from Borland. Version
2.0 does not use any of the original Borland code, so ASH wants to
stop paying the license fee. The thing has been tied up in court
for years now.

View the output of your program as row of data-packages, whereby
all packages have the same structure. For visualizing of this row
do this:

1) create a dialog with respect to the package-structure as
part of your rsc-file.
2) At the beginning of that program-run, which shall be presented,
call the whole dialog with objc_draw(...)
3) Whenever a new packages arives and shall be presented
in the dialog, initialize the parts of the rsc-part, which
therefore must get a new content. Refresh the output by calling
objc_draw(...) again, but in this time only for the dialog-part,
which has got a new content.

Very nice feature would be the dialog-presenting as content of
an own window. Connect window-management and prsenting of dialogs.

Note: In both cases you need a full GEM-environment with the
most important parts between appl_init(...) and appl_exit(...)!

If you want to display a dialog without stopping, just don't call
form_do(). objc_draw() will display everything EXCEPT the templated
TEDINFO objects. These can be drawn by calling objc_edit() twice
for each, ED_INIT and ED_END.

If you want to display stdout in a window, there are a number of
ways to accomplish that. The easiest is to use Geneva.

I think the best is turbo assembler 1.7.6 (or 1.7.7 I am not sure on what's the last version. It's fast, has a great debugger (bugaboo) and is realy good in finding optimisations in you code (conversions of bra in bra.s and move.w adress,d0 into move.w adress(pc),d0 etc.

I think it's available on most Atari ftp sites, but also on most BBS's like Bearbord BBS.

I recently began programming a GEM application again,
I haven't done that since I quit programming in GFA Basic
and went on to learn C about two years ago...
It took me hours just to get a slider in a dialog to work,
as I have little GEM docs...
(I ended up using the GFA documentation on GEM :-)

Anyway, there's one thing I just can't figure out:
Even though I do a form_dial(FMD_START,...), mouse clicks seem to
be getting "shared" between my dialog (plain-old-non-modal type)
and a background application (for instance TOSWIN or the Desktop).
I use Sozobon C 2.00x (with XGEMFAST libs) and MultiTOS.
Anyone know what's wrong here?

-=Levjenno

PS. I call form_dial() in the following manner:

```
int x,y,w,h;
form_center(tree,&x,&y,&w,&h);
form_dial(0,x,y,w,h,x,y,w,h);

/* Dialog stuff (using form_do) */

form_dial(3,x,y,w,h,x,y,w,h);
```

I'm replying to this from work and therefore don't have access to the
Atari Compendium but, from memory, shel_write() mode 0 was introduced
with AES 4. Attempting to use it under single TOS will result in a
crash. It doesn't crash under MagiC, it doesn't do anything else either
though.
AES 4 was designed as multitasking AES. AFAIK, no existing commands
were changed just new ones added. shel_write() mode 0 is specifically
designed to get the OS to launch another application concurrently with
the calling application. Concurrently means both programs may be
accessed. It is specific to AES 4 and above since, as far as TOS is
concerned, no version lower than 4 is capable of multitasking.
To state that because a command is not available in earlier versions of
the OS it is incompatible is daft. Once the newer version is installed
the command is available. It is up to the application programmer to
ensure that the system their program is running on supports the newer
command before using it.

> Another way to launch programs concurrently is Pexec(100). But if you think
> that you need AV to start a program you most probably never heard of Pexec.
>
Don't be ridiculous! Of course I've heard of Pexec. It is the command to
launch programs as child processes of the calling application. Although
similar, it does not do the same job as shel_write because the child
program has control of the system until it is terminated whereupon
control returns to the parent. This is true even under multitasking
systems (including MagiC).

Of course I don't think you need AV to start programs. It is obvious
that there is another way. However all the programming docs for MagiC
are in German and one of my shortcomings is that I don't speak German.

This isn't the issue. Adding mode 0 support to MagiC would change
nothing. All programs that didn't use it would continue not to use it.
Programs that could use it (such as MultiPlicity and Thought!) would
benefit but nobody would lose.

> Instead of complaining about version 3.99 tell us how to start programs

No, sorry, still not following this. Most of the shel_write() modes ARE
single-tasking since they were implemented prior to AES 4.

While form_dial() supposedly reserves space on the screen, the
window manager doesn't honor it. There are two solutions: call
wind_update(BEG_MCTRL) to turn off multitasking before calling
form_dial(), or put your dialogs into windows.

What Andreas means is that Magic doesn't have toolbar support,
but (he claims) that the other AES's that do support toolbars dont
have a shel_write() (or other method) that co-exists with
Single-tasking.

I'll leave you to fight over Pexec() as I've never bothered to
look into this call in much detail. :)

I think the form_dial call has to be wrapped between
wind_update ( BEG_MCTRL ) and wind_update ( END_MCTRL ) calls.
This will tell GEM that your dialog is taking over all mouse activity.

Agreed. Except that STOS games generally don't work on the higher-end
hardware without patching (and even then its a bit dodgy). At least
with GEM games they (should) work on all versions of ST and derivatives.

I like STOS a lot and used to write in it all the time (not just games)
but it really doesn't work on a Falcon and so I haven't used it for
about two years. I was disappointed about that.

<cough, cough>

I beg to differ... STOS does work very nicely on the Falcon - once it
is set up properly. Using appropriate extensions you have full access
to the Falcons extra hardware etc. The only drawback is that it must
be run in an ST compatible resolution (HI as well - you can switch to
/ from ST High with my extension) as the editor/interpreter is not
designed for high-resolution modes.

:-)

Ok 2 points....No one makes decent games in GEM, certainly not fully
fledged platformers etc, I am talking about 1996 onwards, I am not
aware of anyone even contemplating such a thing?
Secondly, You can now fix your compiler, this means the games you
compile will be fixed to work on any TOS versions you want, Including
all the Falcon versions, you have to follow a few programming
guidlines, things like not switching resolution anymore?, but if you
own a Falcon then I would say STOS is exactly what you need,

>I like STOS a lot and used to write in it all the time (not just games)

Same here, Diskzine shells, text readers, multimedia kit, I have
released allsorts of stuff in STOS,

>but it really doesn't work on a Falcon and so I haven't used it for
>about two years. I was disappointed about that.

AAAARGH what doesent work??? STOS not only works but there are now
upgrades (extensions) that allow you to access falcon specific stuff,
true colour sprites? and and and...ho just everything Falcon,

If you have a Falcon and want to program, visit my page and look at
the file site, here you can link to Anthonys Falcon extension and
Generic fixer and much more,

STOS works great on the Falcon and now takes full advantage of
everything the Falcon has to offfer...How I wish I had a Falcon:)

Sorry to rant, but its a pet hate of mine, how people tried STOS
years ago, formed an opinion, and decide thats that, THINGS GET
UPGRADED but people prefer to think what STOS used to be like ???????

STOS has been upgraded!!!!!!!!! see the STOS.FAQ

Ok...

here is what you do:

install STOS.
----
install files on you HD
run Generic STOS Fixer on BASIC206.PRG
rename to BASIC206.TOS (improves graphics commands)
put fgraphic.exx and faudio.exy in STOS\ folder
run from ST-low (no NVDI... control boot is safest)

The STOS editor should now work.

install compiler
----
install files on you HD
fix (MUST use a Generic fixer) COMP207.BIN
put fgraphic.ecx and faudio.ecy in COMPILER\ folder
compile a program
run it from ST-low (control-boot)

read the manual to Generic STOS Fixer for details on compatibility
issues. Read the manual to STOS Falcon extension for details about
Falcon only commands.

Both are available on the WWW at my pages, or via FTP somewhere...

Falcon extension is shareware, of course...

: I'm not certain my example above will work; it probably depends on
: how the library implements form_alert, appl_init, and so on).

There is only one MT safe AES library. I wrote MT_AES.LIB when I
introduced threads (in the UNIX meaning, i.e. one process can have
many threads) in MagiC 5.
Any other AES library will cause crashes.

Andreas Kromke wrote:

> No. (lots)

Help me out here will you. I take it from "No" you disagree with what I have said. An explanation as to why might have helped. I'll be the first to admit I'm not the world's greatest GEM programmer and in the absence of any MagiC programming documentation that I can read, I can only go by my own experience.

When I wrote MultiPlicity it worked perfectly under single-TOS (using Pexec) MultiTOS and Geneva (using shel_write() mode 0). I bought MagiC 4 when it became available and MultiPlicity wouldn't call external programs under it. This was because shel_write() in mode 0 did not work under MagiC 4. I haven't tried it under v5 since the AES is still 3.99 and therefore I assume that no changes have been made here. I spent two weeks trying to get MagiC to behave as I expected it to before opting for the AV solution.

Lets be honest here. MultiPlicity was written as my final year project at university. Its primary function was to get me good marks and a good degree (which it did). The two lecturers whose job it was to assess my project only knew as much about Atari computing as I told them. I could therefore have got away with demonstrating MultiPlicity under Geneva and made NO attempt to get it work with MagiC and still have got the same mark. It was important to ME though it worked under MagiC which is why I spent time I could ill afford trying to make it do so. I readily admitted in the docs that my answer was not a solution but a workaround and I would continue to look for something better. I haven't found it yet but you are talking as you know the answer but just don't want to share it. If you really do how to do this then I would appreciate your help. Even if you don't, please try to substantiate your claims with something more than arrogance.

Incidently, why should I want to lie about MagiC? I don't have a warehouse full of alternatives that I can't shift and trying to discredit any Atari software does no one any good. I am simply stating what I see to be the truth. With one or two caveats I think MagiC is wonderful - it's just not perfect and I don't see why I shouldn't be allowed to state that. On the shel_write() issue I would be quite happy to proven wrong since it would solve a lot of problems. I don't like the AV workaround any more than you for the reasons previously stated.

Regards
Martyn

You need to stop the screen manager getting in on the act by blocking
it - otherwise apart from pinching your keys, it will let windows
scribble over your dialogue ... :-)

```
wind_update(BEG_UPDATE/*1*/);
wind_update(BEG_MCTRL/*3*/);
form_dial(FMD_START...)
..
form_dial(FMD_FINISH...)
wind_update(END_MCTRL/*2*/);
wind_update(END_UPDATE/*0*/);
```

Heartland works fine on the falcon. You have to use stos fix though...

It is very imprtant to do a correct init and not using the desktops.
If your program is using the desktops handle
and then if your program crash it will probably hang the system.
And it is not a clean way to program.

If you are going to use the VDI at all, you should always open your own workstation. It is not, strictly speaking, necessary, but it is a very good practice. It may even be required under MultiTOS, if I recall correctly.

If you don't use any VDI calls (or only things like v_show_c(), which don't alter any workstation attributes), there's no need to open a new workstation.

Please refer to comp.sys.atari.st. I posted a documentation of the parallel
shel_write() call in MagiC. This posting refers to MagiC 2, but the facts are
still true.

: first to admit I'm not the world's greatest GEM programmer and in the
: absence of any MagiC programming documentation that I can read, I can
: only go by my own experience.

So tell: "I did not find another way" instead of "There is not other way".
And do not think that something makes sense only because Atari Corp. (RIP)
did it.

:
: When I wrote MultiPlicity it worked perfectly under single-TOS (using
: Pexec) MultiTOS and Geneva (using shel_write() mode 0). I bought MagiC
: 4 when it became available and MultiPlicity wouldn't call external
: programs under it. This was because shel_write() in mode 0 did not work
: under MagiC 4.

No, this is because you called shel_write with mode 0 instead of shel_write
with mode 1 like in Single TOS. You made the assumption that anything
except Single TOS uses mode 0 like MultiTOS. And this assumption was wrong.
appl_getinfo() clearly tells you that MagiC's mode 0 works like in TOS,
not in MultiTOS. So your program should have used mode 1 as it does with
Single TOS.

: help. Even if you don't, please try to substantiate your claims with
: something more than arrogance.

Don't you think it is arrogant not to distinguish between assumptions and
facts and to tell here that something does not work instead of asking what
you might have done wrong?

This is not a very good idea in many senses.
All settings, such as line colour, width, style, marker colour, size
etc. etc. will be saved and used by the desktop as well. And if your
program is running as an accessory, it and the desktop would both change
the settings, and VERY unexpected result will happen.

There's probably a lot more reasons not to do it that way, and besides,
it's not really that much work to do a v_opnvwk.

Depends on your definition of making games... STOS comes with a great set of general usable routines for games, but if you want to make your games the best of the best you have to design your own specific routines.
If you get to that point C is the most flexible solution, I think, but you have to do all your grapic and sound routines yourself because there is no standard library for graphics work.

If it comes to basic I prefer Omikron basic. Ever seen my Demounstures demo vor ST/STe? It realy beats the hell out of all other basic demos I have ever seen. Considering making demos is about as hard as making games I think your statement is proven to be wrong. ;-)

Bye Hans Wessels

BTW: use assembly to do real work and make the framework in C!

Hans

I think this sounds just like Andreas. You can't comment on MagiC without
he jumping on you, saying that MagiC is best. If MagiC can't do it, don't
do it. Great. If you are realy lucky he wil leven say two words!

As Andreas should know about most questions asked here it shouldn't be that
damned hard to answer them insteed of being arrogant, becuase that he is!

We all love/like MagiC, but we find some shortcommings from time to time.
Why not try to fix them insteed? The guy who is doing Geneva (sorry I can't
remeber his name right now) seems to be much more helpfull and if there is
something missing, or like with the new AES calles that some guys come up with
for XaAES/oAESis, quickly picked them up and add them. With MagiC you don't
get much respons. You only have to upgrade three times per year to get some
more pointless features insteed of AES 4.1 compatibility.

What I would like to see in MagiC before they start playing with VFAT and other
stupied things would be _true_ AES 4.1 support and better memory protection
which would make it alot more stable. It's a great OS, but it's not perfect, but
there isn't anythinkg saying that it couldn't be.

I must say that I like MagiC very much. Anything else would be a lie but I want
my toolbars.... :-)

TINWIS. Paraphrasing a little, I said that the MagiC AES is not fully
AES 4 compliant (which it isn't) and one of the missing parts was
shel_write() in mode 0 (which it is).
It doesn't matter whether it made sense the way Atari did it. The fact
is that Atari were the originators of the OS and any replacement for
that OS must do things the same way (at least at programmer interface
level) or risk programs that worked perfectly under TOS not working
under the replacement. Like it or not TOS is the standard.

Like I said, MagiC does not use shel_write() in mode 0. Thanks for the
info on mode 1 though. I'll try it. I have since looked up this call
and got conflicting stories - though the end result is the same.
According to the Atari Compendium mode 0 was introduced with AES 4 and
should not be used with AES versions lower than this. The Lattice C
docs state that mode 0 is theoretically available for all versions of
AES but a bug in every version of the AES up to 4 means that it doesn't
work.

> : help. Even if you don't, please try to substantiate your claims with

No. As far as I am concerned I followed Atari's programming instructions
for a multitasking system. The fact that it worked without problem under
both Atari's official multitasking system and Geneva is testement to
that. The lack of any decent documentation for MagiC means that I only
have two other ways of finding things out about the system: Asking the
UK distributors, System Solutions; and my own observations. I observed
that shel_write() mode 0 did not operate under MagiC and a phone call to
SysSol for help confirmed that. I was perfectly correct to state that
mode 0 did not work and that the MagiC AES is not fully AES 4
compliant. Where, perhaps, I didn't make myself clear was in saying
that I had used AV to get round the problem without stating that I was
aware that it wasn't the best solution. I was just trying to be
concise.

Agreed. Dan Wilga (for that is his name) is extremely good when it
comes to support. When I first got my Falcon I found that Geneva TOS no
longer worked (I should point out that this was a few Geneva versions
ago). Within 24 hours Dan had come back with a way to fix the problem.
That's service!

VFAT is very nice but really more trouble than it's worth. Kobold
doesn't understand long file names and doesn't default to to the
shortened versions (though I guess this might change with v4) and disk
maintenance on VFAT partitions is a thing of the past. Plus I then have
to put up with Diamond Mirror telling me that the VFAT partition is
faulty. I realise that this is older software not understanding VFAT
but I have no removed it from all partitions.

Theres isnt much leeway is there? making games means making games,

>general usable routines for games, but if you want to make your games the best
>of the best you have to design your own specific routines.

What? I do design my own routines, In BASIC?.... I (and no one else
should) ever use any of the original STOS routines, they are,slow
,stupid and for the most part unusable

>If you get to that point C is the most flexible solution, I think, but you have
>to do all your grapic and sound routines yourself because there is no standard
>library for graphics work.

Sorry but I do not understand your point here, I am debating the best
programming launguage for making games, between ANY BASIC and C, yet
you seem to be telling me how awkward to use C is,
Show me a top game made in C ? something thats better than one I can
show you in STOS?

>If it comes to basic I prefer Omikron basic. Ever seen my Demounstures demo vor
>ST/STe? It realy beats the hell out of all other basic demos I have ever seen.
>Considering making demos is about as hard as making games I think your statement
>is proven to be wrong. ;-)

Demos are hard to make, and about as usefull as a glass brick,

Dont show me demos, show me a game made in BASIC that is better than
any I can show you made in STOS BASIC,
Show me a game currently being made NOW in BASIC that beats any I can
show you currently being made in STOS,
Demos are not games...
You have not proved me wrong at all, more like tried to twist the
challenge,

>BTW: use assembly to do real work and make the framework in C!

real work, hahahahahahahahahahahahahaha did you not understand my
original question?

Anyone else out there who wants to debate the point that I say STOS
is the best BASIC for making games, without talking Demos=not games
and without suggesting Assembly....real work my foot

< BIG SMILE >

BTW Yes Assembly is more powerfull (and less fun) but then again,
thats why I did NOT include it in the challenge ?

Cheers.............!ynoT

3528. 6502 binary format & xassembler

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-13 00:00:00 UTC
From: fachat@physik.tu-chemnitz.de
Message-ID: <56cbdp$at6@narses.hrz.tu-chemnitz.de>
Source record: 8671
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.programmer,comp.sys.apple2.programmer

Hi there!

After the discussion has been going on for a while in the cbm newsgroups,
I decided to ask other people what they think about it.

I have designed a 6502 relocatable binary file format binary. This
format is preliminary and I'm still collecting ideas as how to
make it more useful.
I also have an assembler (written in ANSI-C) that can produce this
format.

But first I like to here your comments, esp. what you think about
the usefulness for an 65816, as I don't have any info on this one.

Thanks
Andr&#65533;

----------snip----------

6502 binary relocation format V0.9, as of 02nov1996

(c) Andr&#65533; Fachat (a.fachat@physik.tu-chemnitz.de)

0) What it's for?

With some new 6502/C64/C128 operating systems comes the need for a new
binary format that allows relocating an assembly language program to a
different location.

This text tries to find a) a good solution to this problem for the 6502 CPU
and b) an assembler source format to use this format in a general manner.
It doesn't try to define or discuss object file or library file format,
which can be implemented differently by different assemblers.

1) 6502 specifics

The 6502 has the special feature of a 'zeropage', i.e. a very limited
memory address range used for special addressing modes. So the format
should not only provide a means to relocate absolute addresses but also
zeropage addresses.

The stack is also very limited. A binary format should provide a measure
of how much stack space is needed for the application.
An issue still to be discussed should be if stack addresses should
be relocated and how. The C64 basic interpreter uses a lot of the stack, for
example. But I tend to leave the (limited) stack for its real purpose,
as stack!

Such limits should be defined as 2 byte values, even if the 6502 only
has a range of 1 byte. But the 65816 behaves differently (?).

Another problem is, that an address can be 'split', i.e. you can just use
the high byte or the low byte separately in an opcode. This gives need
to a special relocation table format, that can cope with half-address
references.

2) assembler source format (as of xa-2.1.0d, 02nov1996)

As already used in other formats, the assembler uses three different
segment types, i.e. text (the actual program code), data (initialized
variables), and bss (uninitialized variables). In addition to that, the
6502 format also includes a zeropage segment type, to allow zeropage
variables to be relocated. This zeropage segment is like a bss segment,
in that only the length, but not the data is saved.

In 2.1.0 there is a way to temporarily disable the creation of relocation
table entries. This way absolute code can be inserted into a file. This
code should then be copied to the right location at runtime.
(Later versions will also provide a way to 'embed' relocatable files
in an absolutely addressed code. At least I want to build some operating
system ROMs with that...)

2.1) allocation of data segment/zeropage segment address space

The assembler switches between the different segments by the means of
".text", ".data", ".bss" and ".zero" pseudo opcodes.
The text segment contains the program code. Data holds the initialized data,
while bss and zero segments contain uninitialized data for normal/zeropage
address space.
Everything that is between one of these segment opcodes and the next segment
opcode gets into the corresponding segment, i.e. labels, assembled code etc.
The text and data segments are saved in the file, while for the bss and
zero segments only the length is saved in the file.

2.2) referencing data/bss/zeropage addresses

One problem with the 6502 is, that it cannot load an address within one
step or assembler opcode. So an address is loaded with standard byte
opcodes, like "lda #<label". But how do we decide, whether "label"
is an address or not, and what do we if we get something like
"lda #zp_label + 12 * label2"?

The assembler is now intelligent enough to evaluate such expressions
and check for:

- no address label : ok, absolute
- one address label, only add to label : ok, relocate
- difference between two addresses : If addresses in same segment, compute
diff and set absolute, otherwise bail
- everything else : warning

This way there is no change in syntax. Address labels are distinguished
by using the "label:" syntax, as opposed to "label = value". Well, my assembler

can also use the first syntax without the colon, as here everything is a label
that is not an assembler opcode.

3) binary format

I have seen three ways to handle the relocation problem so far:

- tables: have a relocation table for a text segment
if relocation table is put in front of code (as braindead MS-DOS does)
you have to save the table in a side-storage
if table is behind, you still cannot relocate 'on the fly'.

- deassembling: go through the code, deassemble it and change all absolute
addresses. Problem: needs to know / have hints about where some
data is in the code.

- relocation info in the code: Here each address is preceeded with an 'escape'
code and is relocated when loading. But this disallows block oriented
transfer from storage media to memory.

I therefore prefer the first method, with the table after the code/data.
So I can use block oriented transfer for the text/data segment. And while
reading the relocation tables bytewise, the relocation can be done without
the need to save the table somewhere.

The proposed standard extension for the described format is ".o65".

The binary format is the following:

```
------------------------------------------------------------------
header
.byt $01 ; version
.byt $00 ; non-C64 marker
.word tbase ; address to which text is assembled to
; originally
.word tlen ; length of text segment
.word dbase ; originating address for data segment
.word dlen ; length of data segment
.word bbase ; originating address for bss segment
.word blen ; length of bss segment
.word zbase ; originating address for zero segment
.word zlen ; length of zero segment

{ ; optional options, more than one allowed
.byt olen ; overall length (including length and type
; byte
.byt otype ; option type
[ .byt option_bytes ]
}+
.byt $00 ; end of options marker (i.e. option len=0)

text ; text segment
data ; data segment
```

```
reloc_text ; relocation table for text segment
reloc_data ; relocation table for data segment
external ; list of external references
globals ; list of global variables
-----------------------------------------------------------------
```

The header options currently defined/proposed are:

```
- Filename
type=0; len=[variable]; content=string,0

- Adrlist
type=1; len=[variable]; content= address pointer list
The addresses are relocated as if they point to the text segment
An OS might use this as general jump table (may be for libraries?).
But It's better to have an own jump table for each OS; that would even
allow one binary for multiple OSes (like OS/A65-Adrlist -> init adr,
Lunix-Adrlist -> init-adr, list of exception vectors etc...)
(Should I drop this one?)

- StackSize
type=2; len=4; content= data word describing the minimum needed stack size.
The OS should add an appropriate value for it's IRQ routines and stuff.

-----------------------------------------------------------------
```

The text and data segments are just the assembled code.

The relocation tables are (each):

```
{ [255,...,255,] offset of next relocation (b), typebyte|segmentID [, low_byte] }+
```

where typebyte is one of

```
WORD $80 2 byte address
HIGH $40 high byte of an address
LOW $20 low byte of an address
```

and segmentID stands for the segment the reference points to:

```
0 absolute value
1 text segment
2 data segment
3 bss segment
4 zero segment
```

```
The offset is a one byte value only. If the difference between the last
relocation address and the next one is larger than 254, a 255 is put
in the offset byte, and 254 is substracted from the difference, thus allowing
to continue without a zero offset byte.
A zero offset byte ends the relocation table. The first offset is computed
from the segment base address-1, to avoid a 0 value in the first entry.

-----------------------------------------------------------------
```

A format for the external refernces list (i.e. a list of undefined
references) is not (yet) defined

The global list is:

{ "global_label_name_in_asc",0, segmentID, value.w }+
.byt $00

This approach allows

a) using BLOCK transfers, as no relocation info is hidden within the
code or data itself;
b) It needs no (not much) side-storage, as a segment can be read using block
transfers and then, while reading the relocation table, being
relocated on the fly. The only side-storage is the list of segments
with corresponding memory offsets. See the provided basic 'loader'
code.

Possible Changes to the format are:

- put the minimum stack size into the file header, not into an option

- have an additional byte to flag that the relocation table only allows
pagewise relocation. Well, this would insert a word at position 2
(i.e. after the initial .byt 1,0 and before the text segment base address.)
The flag would then be one out of 16 possible databits.
[This change has a high probability, I think....]

- Have possibly multiple objects in one file

- add a "static data init" function address header option that gets
called after loading but before the thing is executed. This could
make runtime linking easier, when each object is one function and not
a whole program.

Yeah. I have never used Genevea, but I have always found Dan Wilga to be more
than helpfull after reading these groups. Maybe it's time I buy a copy just
for the excellent support? :-)

I guess you ment "now removed"? Actaully I'm thinking of removing it as
well. As you said, it realy make more trouble than it's worth. :-\

I actually havn't got one file with more charachters than 8+3 as they
get wacky under TOS and I use TOS regulary as well.. :-)

>library for graphics work.

Argh!

You mention library routines for C, yet not for STOS! You do not have to use
the standard STOS sprites - in fact most (good) STOS programs DO NOT use the
STOS sprites (or music, or joystick or...) routines. They use library routines
which are much more efficient. These are called extensions BTW, and there are
LOTS of them (check the STOS FAQ for info on what is available).

If you still dont think it is fast enough then you can write your routines
in assembly language and use them within STOS as has been shown by eg. BombSquad
which does exactly this.

I am not saying that STOS is better than other languages (I have used quite
a few, and do find STOS one of the easiest to write complex programs in) but
I would say that it is wrong to assume that STOS is not as good as C for the
reasons mentioned above. (one valid reason might be the lack of proper functions,
but these can easily be simulated with gosubs)

>any advices ?

Each vdi handle identifies a structure which holds the current
attributes. If you use the aes handle then any changes you make will
may also affect the "desktop" and vice-versa. Even if a particular
operation appears to be ok you cannot guarantee it will be so in any
other context. Thus it's a bad idea.

Part of the vdi idea is it allows you to open multiple workstations
with different attributes. Instead of having to keep changing the
attributes all you need do is change handles.

> ,stupid and for the most part unusable

No, a midrange car brings you to every place you want. If you want maimum prestations you have to tune and modify your car...

> Sorry but I do not understand your point here, I am debating the best
> programming launguage for making games, between ANY BASIC and C, yet
> you seem to be telling me how awkward to use C is,

or even design and build your own one. It's far more work, it's hard work, but the result might be far better than a regular care made of standard parts.

> Show me a top game made in C ? something thats better than one I can
> show you in STOS?

Civilization is done in C and Colonial conquest too. I don't know the amount of assembly that's used in those projects. It's quite easy to design your code in C and optimise the most used and most time consuming parts in assembly (I use that method in my current projects). I think most simulation games like (Railroad Tycoon, Simcity) are done in C with maybe some assembly. Oxyd is done in Modula 2.

> Demos are hard to make, and about as usefull as a glass brick,

They show you the limit of the computer in combination with a certain language and the imagination of the coders.

> Dont show me demos, show me a game made in BASIC that is better than
> any I can show you made in STOS BASIC,

I can't. Most games I know of are written is assembly (maybe C, you have to step down to the Basic level to see anything like 'sorry for the worse gameplay, but it was written in basic;. ;-))

> Show me a game currently being made NOW in BASIC that beats any I can
> show you currently being made in STOS,

FUN ((ex)DBA) is working on a great game in Gfa Basic. I haven't tested it yet nor have I seen any STOS games lately (the last time I have tried a STOS game I had to switch TOS version, in that time (long, long ago) STOS crashed on TOS 1.04.

> BTW Yes Assembly is more powerfull (and less fun) but then again,
> thats why I did NOT include it in the challenge ?

So, there is the point I am trying to make. Writing games in assembly is very hard, but you can get the best results. In C it might be somewhat less difficult, but at the same time you can't reach the best assembly level. In STOS basic on the other hand, there are a lot of easy to use routines to do the hard grafix work for you (and to paly samples and so on) but at the same time you lose the absolute command over your code. To reclaim the absolute command you have to write all the impartant routines yourself. When you get to that point there is no significant difference between the various basic dialects and you are writing assembly code in basic (lots of pokes and memory moves, clockcycle counting and
preshifting of sprites). Maybe I am thing too much as democoder on this point.

Bye, Hans Wessels

Nope, I was telling you the standard C library is not usable for game design and that you had to create your own library. When you can create your own libraries it doesn't matter anymore wich language you choose to write the game framework in. Most mordern languages allow you to call external routines in a more or less easy way.

> If you still dont think it is fast enough then you can write your

So it ends in a game where al the main game routines are assebly and only some disk routines and initialisation is done in the original language you started with. (I have done that once, converting every routine that used more than 1% of the total execution time to assembly.)

> not as good as C for the reasons mentioned above. (one valid reason
> might be the lack of proper functions,
> but these can easily be simulated with gosubs)

I hope you can declare some local variables after your gosub labels, otherwise you are in BIG trouble when you are calling the routine recursively. (For examble when you are generating a random maze or chacking there is still a way out of the current maze.)

Bye, Hans

>Hm... yea, this could well be true...

From your point of view maybe Anthony, but if you look at it from the
view of a STOS BASIC programmer who cannot write his own extensions,
he uses the ones you and others have released, he then treats these
extensions as upgrades to his language disk, this is after all what
the whole concept of extensions was built in for?
So your average BASIC programmer uses the extensions as upgrades to
STOS, thus he is still using STOS BASIC, albeit an updated version,
therefore anything he produces can (without stretching the
imagination) be classed as written in STOS

>>Most mordern languages allow you to call external routines in a
>>more or less easy way.

>Yes. STOS does this.

Yes it does, as most other lnguages allow this, as pointed out, then
they are on a par?

>>So it ends in a game where al the main game routines are assebly and only some
>>disk routines and initialisation is done in the original language you started

poppycock!

>>with. (I have done that once, converting every routine that used more than 1% of
>>the total execution time to assembly.)

How can this be true, I use extensions and any add ons I can find,
yet I only know BASIC, hmmm how can I put this?, no matter what I do
in my program, however way you look at it, it will all be done in STOS
using STOS BASIC commands, therefore the end result will be a STOS
written game?

>As long as your library routines are efficient enough, then there should be
>no need to convert most of the routines to assembler. Only if there is no
>library routine which does what I need have I turned to assembler... (which
>I put into a library routine, so that other people can use it if they need it...)

again...to you it is an assembler routine, but if packaged in the
form of an extension, and given commands to utilise it, then its a

BASIC upgrade :)

>As I said - the lack of proper functions IS a limitation of STOS.

Sorry Anthony, could you explain that last sentance, whats a proper function? and why does it limit STOS, although I am unsure of what you speak, I have to say that after over 50 releases, I have never felt limited in any way ?

No, that's the point of opening virtual workstations with v_opnvwk().
Even though it does use the same screen for all output, all attributes,
such as line style and colour, marker height and color aso are specific
for the virtual workstation you open.

You may also open more than one virtual workstation, if you like. This can
be very useful if you regularly use two (or more) different attributes, so
that you don't have to change them all the time.

>error, but the resulting PRG file crashes when invoking my assembler
>routine.
>Is this normal, or what?

You may want to review your compiler settings. There some options
pertaining to external calls. You may also check to see if you need
to be in supervisor mode for the area of memory you are poking data
into. (ie. protected system memory).

-Jared

3543. OS Extension concept

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-14 00:00:00 UTC
From: atari@teleport.com.REMOVE.THIS.TO.REPLY
Message-ID: <56fs3h$afk@ornews.intel.com>
Source record: 8597

Had a thought (I know, mark the calendar! <G>) and, while I am not competent to implement it, surely there's someone here who is.

One feature that TOS lacks is the ability to add extensions easily; that is, while I can install any file type to call an application, that app will open a workstation (in most cases) and display something on the screen while running.

I'd like to see the ability to simply double-click on, say, a WAV file and have it play through an "extended OS" which doesn't use any screen memory at all. Such an extension ot the OS would, I imagine, have to load in the AUTO folder before GEM starts, and would add the supported filetypes to the internal list of executables; however, when one of the "new" executables was launched, the OS extenstion (let's shorten that to "OSX") would intercept the call and, instead of attempting to /run/ the file, would handle it as data for internal routines that would read the file, determine if it was the proper type (in my example, a RIFF WAV, AU, RA, or other audio file with built-in playback parameter data) and then execute code to do something with the data file (our example audio player would route it to the Yamaha chip, the DSP, or the STe DMA sound microwire). If the data type was unsupported, the usual OSX would let it "fall through" to the usual OS routines for TOS and GME applications.

Comments, suggestions, or explanations of why I am too stupid to live (with charts and diagrams) welcome.

> if so then thats total rubish!

No, I am telling you that while programming and optimizing your game you will get to a point that your standard (or library) routines can not improve your speed anymore and you will have to write your own, very specific routines to improve the game more.

> hmmm "might" ?, I say might NOT, I am willing to show that STOS BASIC
> is the best for making games in 1996 between any other BASIC and even
> C, That was the original question

Yep, and I am trying to tell you your statement is too general. I am quite sure C or Gfa basic are far better to produce a game working under GEM running on every Atari under every resolution and TOS version.
Example? Nethack (it was written in C\C++) works in ST LOW, ST LOW overscan (400x240), ST HIGH, ST HIGH overscan (720x480) and on the different TT resolutions. I even expect that game to run on a Hades 060 or Magic Mac. What about text adventures? That are games too! If I had to do a text adventure my primairy choice would be C! You told me that making games is making games so these types of games are not to be excluded.

>> Civilization is done in C and Colonial conquest too. I don't know the
>> amount of assembly that's used in those projects. It's quite easy to
>> design your code in
> C
>
> Neither do I, so surely that excludes them from the debate ?...next:)

No, lets say they used a graphics library someone wrote. I think the amount of assembly code in Colonial Conquest is quit low because it runs on a TT and gets a great performance improvement from a screen
accelerator.

> Yes they do don't they...and IMHO are STILL as usefull as a glass
> brick?

Just as games are?

> Then how do you know its great and how do you come to the conclusion
> that it is better than a STOS game ?

Well, I was not telling you it will be better than a STOS game, I was telling you they were making a great game in Gfa. I know it will be a great game because someone with a good taste for games was telling me so.

> Here we go again, WHY does everyone have to base there opinions and
> debates on STOS of old, STOS HAS BEEN UPGRADED! how many times does

Yes, reading this newgroup I understand all works fine on a falcon as long as you write your own keyboard routines. No problem for you, you will call it a upgrade (I would call it a cludge) and for a new piece of hardware you will have to wait untill someone cares to 'upgrade' your basic so you can use the new features, C however will produce working code for the new hardware.

> this have to be said, TOS compatability is no longer a real problem,

> that when I VARPTR or maybe when I use BINARIES that these are not
> BASIC commands? memory moves and anything else you wanna mention are
> all valid BASIC programming,

No, I am saying that writing a program that manly exists of peeks, pokes and memory moves is almost the same as writing the code in assembly. Only in assemply you call peek and poke move.

> BTW Hans..do you have an STe? or FM? Can I send you one of my games
> in return for the Demo you wrote ? <SMILE>

I have got an 1040STf with 4Mb of memory. Please send me one of your games. But send it to: mr_ni@mst.tn.utwente.nl . It's my e-mail adres at the university and it's a lot cheaper for me to get large amounts of data on that adres. I will send you my demo.

Please tell me about it. I have heard STOS memory management is one of the worst available. Scavy programed chipmon II in STOS. It worked fine on a 4MB STe. However on 1MB ST you had to wait ages for STOS to complete its garbage collections.

> spacially and computationally efficient form)

No, you can nor convert any recursion into a while loop, at least not without a sort of stack emulation. Comming to that point I am sure it's faster to and more memory efficient to use the build in stack mechanism of the 68000.

However most standard examples of recursion in programming courses are examples of 'false' recursion. A recursive algoritm to calculate x! is a well know example of false recursion. Those false recursions ca be rewritten as a while loop.

But tree traversel routines realy do need recursion. Like routine that outputs the data stored in a binary tree in order:

```
struct node_s /* definition of nodestruct */
{
node_s *c_left; /* pointer to left child_node */
node_s *c_right; /* pointer to right child_node */
key_type key; /* Key of the node */
};

traverse_tree(node_s *node)
{
if(node->c_left!=NULL) /* is there a left child? */
traverse_tree(node->c_left); /* yep, first print values
in the left part of the tree */
output(node->key); /* print value of node */
if(node->c_right!=NO_NODE) /* is there a right child? */
traverse_tree(node->c_right);/* print values of right part of tree */
}
```

Most games don't need those more complex data structures and routines to handele them.

Bye, Hans

> painting the screen??

I haven't seen you original question but it looks like you are working on a
sort block-copy using movem.

On the 68000 movem is the fastest way to move (huge blocks) memory around. The
fastest way to copy a block is somethin like this:

```
movem.l d0-d7/a0-a7,register_storage ; save registers
lea source_adress+length-56,a0 ; end of source block - 56 bytes
lea dest_adress+length-,a1 ; end of destination block
;start the copy
movem.l (a0),d0-d7/a2-a7 ; load 56 bytes
movem.l d0-d7/a2-a7,(a1) ; write 56 bytes
movem.l -1*56(a0),d0-d7/a2-a7 ; load 56 bytes
movem.l d0-d7/a2-a7,-(a1) ; write 56 bytes
movem.l -2*56(a0),d0-d7/a2-a7 ; load
movem.l d0-d7/a2-a7,-(a1) ; write
; ......
; until the whole block is moved
movem.l register_storage,d0-d7/a0-a7 ; restore registers
```

Notes:
*source and destination adresses have to be even.
*Because we are using the stack you can to this in user mode, or in supervisor
mode with the interupts disabled.
*You can use the routine to write a patern in memory by loading the registers
with the right values and deleting the load statements. The routine will write
56 byte blocks so you patern size can be 56, 8, 7,
4, 2 or 1 byte(s).
*If you prepare your data the right way you can use a postincrement instruction
((a0)+) to load the data into the registers. Example, you can copy a screen into
a buffer using (a0)+ for the load sequence. The data in the buffer will be
'scrambled'. But when you copy the data back into the screen using the same
routine the data will be restored correct.
(move.b (a0)+,-(a1) will store the bytes reverse ordered at the destination
adress, but when you copy the data back to the source using the same move.b
(a1)+,-(a1) the data will be restored correctly.
Modifying the routine with a post increment source adress has the same effect,
only this time 56 bytes blocks will be stored backward.)

I hope this gives you enough information to fix you bug.

Hans Wessels

>as well as performing a search through all the Lattice C header files.
>I can't find any trace of this function. Help!

For MagiC (extracts from 2.0 manual intermingled with my waffle) ...

```
#define SHW_IMMED 0 /* PC-GEM 2.x */
#define SHW_CHAIN 1 /* TOS */
#define SHW_DOS 2 /* PC-GEM 2.x */
#define SHW_PARALLEL 100 /* MagiC */
#define SHW_SINGLE 101 /* MagiC */
```

eg. shel_write(mode,gemflag,SHW_PARALLEL,exec,tail);

'gemflag' is usually passed as TRUE for a gem program. FALSE will
launch a non gem program into a vt52.prg window for want of a better
way to describe it. Have a look at SDUU to see this in action.

The relevent part of appl_getinfo() ...

Function 10:
word 1: available modi ...
bits0..7 maximum value for sh_wdoex & 0xff.
bits8..15 Bits from sh_wdoex & 0xff00 which are handled as in
multitos.
word 2: 1: shel_write(0) makes previous shel_write() calls invalid (ie
desktop becomes the successor) In Tos 1.4 & MagiC.
word 3: 1: shel_write(1) starts the program after termination of the
current one (Tos 1.4 & MagiC).
0: starts the program immediately (multitos).
word 4: ARGV via sh_wiscr() supported (1) or not (0).

As I do not have access to multitos I have made no attempt to be
compatible with it. As such, I pass mode=1 currently.

You could try to get hold of an early version of the Devpac assembly from HiSoft -- it was given away on the ST Format cover disk once or twice (although it isn't public domain, as far as I know).

Other than that, public domain assemblers are pretty lame. Get hold of a copy of Devpac 3 from HiSoft -- it's _the_ best assembler, and isn't all that expensive these days.

Different documentation uses different names for all the flags -- it might not actually be called SHW_PARALLEL (I've never heard of that one).

Basically, with Pexec() there are a binch of mode codes which are single digit which all have some meaning (create a basepage, load but don't run, just run, load and run, etc...)

When you add 100 to those mode codes (some of them won't make any sense) it means to do it concurrently, i.e., if you do a load go normally, your program will suspend until the child had terminated. If you add the 100 to it, then both the child and parent run at the same time (I think there's a library function now called tfork() that does this, but that's in the MiNTlibs).

If you add 200 instead of 100, it means to overlay the child on the parent thus killing off the parent and the child inheriting the parent process ID.

All this should be in the Atari Compendium under Pexec(). As for what Lattice C calls these flags, I have no idea -- I use either GCC or Assembly.

Don't flame me for not knowing any of the names of these flags by heart -- Pexec() isn't the widely used function in my line of work.

Cheers,

James Cox

I must disagree with that comment as my latest production is
Falcon-specific and was written in a mixture of STOS and assembler.
It features an extended resolution using the Falcon's hardware, 50KHz DSP
module-player (with very little CPU time), uses the extended joystick
ports and has no problem whatsoever with the Falcon's hardware.

> I like STOS a lot and used to write in it all the time (not just games)
> but it really doesn't work on a Falcon and so I haven't used it for
> about two years. I was disappointed about that.

Well, and you need to do is run a STOS-fixer on the interpreter (the .PRG
file) and then you should be set! You can obtain some extensions that let
you use some of the Falcon's extended hardware, or if you are keen, write
some small assembler routines to use the hardware.

Also, if you write your own keyboard/joystick handler in assembler,
compiled programs don't need to be fixed to run - they will work on any
TOS version. I have done this and it works perfectly!

I am going to stick with STOS, even though I can write the programs in
assembler. It is a very good environment for quickly developing programs
and you can include assembler subroutines to speed up your code. It's
"banks" are a feature that I have not seen in any other language and are
much nicer than "malloc"-ing memory all over the place :)

Yep, well *almost* fullscreen - I didn't remove the left and right
borders, only the top and bottom ones. :) The play area is 304*200 &
scoreboard 304*40, with some other stuff on the right-hand side.

> >I plan to support the Falcon and STe as it is quite easy to adapt code
> >from Falcon to STe and vice-versa. Most stuff I write will require >1Mb
>
> What are you coding this in ?

A mixture of STOS and 68000 (assembler for all the AI, screen updates,
joystick & keyboard handling and sound). The rest of it is written in
STOS (basically holding everything together).

The memory requirement arises from the user of pre-calculated stuff to
speed things up and ofcourse there's the extra ~80Kb for the
extended screen. The compiled program is already 900Kb, so there's no
chance of running it under 1Mb :(

The reason the code is really easy to adapt is that all the DMA sound
system is almost identical between the STe and Falcon (apart from some
registers like the volume, which is microwire in STe). So all the sound
effects worked with no modification. The STe screen layout is the same as
the Falcon's. I used 16 colour gfx to save on memory (the GFX are ~2Mb in
16 colours!!!)

Also, I've got no problems with the joysticks and keyboard as I don't use
STOS's keyboard/joystick handler - I wrote my own. The jaguar joypads are
also the same for Falcon & STe. The blitter code wouldn't need changing
if I had used the blitter. :)

All up, I'm quite happy with how STOS is working on the Falcon now that
I've written some basic routines to use it's features...

I'll finish off the STe version soon as I've finished the last part of my
uni work for this year. It just needs volume control and some checking
for playability (speedwise) in certain areas... news will be listed on my
webpage for it...

Sorry to budge in... I am not sure what the problem is (was not following
thread from the start) but you can find the SHW_PARALLEL in the MagiX header
files. CH_EXIT is documented in the Compendium, look under event messages.

I am using all these in one of my program to start off parallel programs in
several OS including MagiX, MultiTOS & Geneva. As for MagiC, my beta testers
said that it works too. I cannot truely confirm MagiC as I do not own that OS.

Just the note that it's bad style to use v_show_c() and v_hide_c() in GEM
applications, because this (especially resetting via v_show_c()) conflicts
with the AES's own mouse hidden counter. Always use graf_mouse() to influence
the mouse pointer in GEM applications.

Ciao

Thomas

>Nope, I was telling you the standard C library is not usable for game design
>and that you had to create your own library.

Yes, but the STOS libraries (extensions - NOT the STOS commands) are suitable
for use in games - some of them were originally written as personal libraries
which then later got released.

>When you can create your own
>libraries it doesn't matter anymore wich language you choose to write the game
>framework in.

Hm... yea, this could well be true...

>Most mordern languages allow you to call external routines in a
>more or less easy way.

Yes. STOS does this.

>So it ends in a game where al the main game routines are assebly and only some
>disk routines and initialisation is done in the original language you started
>with. (I have done that once, converting every routine that used more than 1% of
>the total execution time to assembly.)

As long as your library routines are efficient enough, then there should be
no need to convert most of the routines to assembler. Only if there is no
library routine which does what I need have I turned to assembler... (which
I put into a library routine, so that other people can use it if they need it...)

>examble when you are generating a random maze or chacking there is still a way
>out of the current maze.)

Nope, you cannot create local variables. However, you can easily create a
stack, and handle it yourself. But why not convert the recursion into a while
loop? (all recursive functions can be converted into this more spacially and
computationally efficient form)

As I said - the lack of proper functions IS a limitation of STOS.

Anthony

Then how do you know its great and how do you come to the conclusion
that it is better than a STOS game ?

>had to switch TOS version, in that time (long, long ago) STOS crashed on TOS
>1.04.

Here we go again, WHY does everyone have to base there opinions and
debates on STOS of old, STOS HAS BEEN UPGRADED! how many times does
this have to be said, TOS compatability is no longer a real problem,
or at least it need not be, I admit to having problems with making my
software run on a TT and certain Falcon configurations, but no more
than game makers using other programming launguages, certainly the old
TOS 206 problem no longer exists at all...as well as most other tos
vesrions,

>

> > thats why I did NOT include it in the challenge ?
>
>So, there is the point I am trying to make. Writing games in assembly is very
>hard, but you can get the best results. In C it might be somewhat less

You are making a point that has nothing to do with the original
question, I have already freely admitted that assembler is best, only
an idiot would try to say BASIC can beat assembler,

>difficult, but at the same time you can't reach the best assembly level. In STOS
>basic on the other hand, there are a lot of easy to use routines to do the hard
>grafix work for you (and to paly samples and so on) but at the same time you

Jeeeeze....ther are no easy to use routines, the easy to use routines
produce "Slow", "Jerky" and "Unresponsive" (where have we heard that
lot before) games, the new commands are far from easy,

>lose the absolute command over your code. To reclaim the absolute command you
>have to write all the impartant routines yourself. When you get to that point

I disagree, I make my routines do everything I want them to
do....have a look at some, then you will understand :)

>there is no significant difference between the various basic dialects and you
>are writing assembly code in basic (lots of pokes and memory moves, clockcycle
>counting and

eh?...

>preshifting of sprites). Maybe I am thing too much as democoder on this point.

I NEVER use anything but preshifted graphics, <?>

No you are thinking correctly, sorta :), are you saying that
POKE,PEEK, LOKE, LEEK, etc are not BASIC commands, are you suggesting
that when I VARPTR or maybe when I use BINARIES that these are not
BASIC commands? memory moves and anything else you wanna mention are
all valid BASIC programming,

>Bye, Hans Wessels
>

BTW Hans..do you have an STe? or FM? Can I send you one of my games
in return for the Demo you wrote ? <SMILE>

Cheers.............!ynoT

Where did you hear this? Could be cool to run a 3D game at the same time as Papyrus. :-)

I have tested Ikarus (3D world running in GEM) on my Afterburner040 and it's actually realy nice (walking wireframe people, flying birds, cars etc.). Something like this could be realy playable running in a GEM window on a decent machine.

3563. Questions about STOS

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-15 00:00:00 UTC
From: bjr@edison.ebicom.net
Message-ID: <56hc77$qsj@einstein.ebicom.net>
Source record: 8606

Aloha...
I'd like to write some small custom programs for personal use...
Some include simple midi programs...printer drivers...and the like...
Also would like to delv a little into multi media type applications
such as Music Tutorials...perhaps even relase a CD for Music Theory and
Jazz Improv studies.
Basicly, I'd like to know if STOS would be a good package to use
for this kind of stuff. It seems like it would be a great package for
creating "educational" software since it must be pretty graphicly adept
to handle arcade games! How does it score on using the various ports...
I guess that's the key question. I can also invision some WAY COOL games
that use a MIDI KEYBOARD as the input device rather than a joystick.
Imagine having 64 to 88 keys to assign various functions! Not to meniton
that most keyboards have at least one slider, a pedal, and those groovy
wheel controlers!
A long time ago I purchased Mark Williams C for my old STf...
It doesn't work on my Falcon...and I never learned to program in C
anyway. I like the idea of using basic commands to call function
libraries...does STOS allow this? I.E. could I find a module compiled
from C, or Assembler, or whatever...and call for it/pass paramaters
using STOS? If so...I'm assumeing the STOS compiler will let you
mix different binary modules in the final compilation? This would ROCK!!!
It'd be like having the flexability of C to call functions from various
compiled modules...but being able to write the MAIN body of the program
in BASIC (which I know fairly well syntex wise).

Brian

Note that the handle you get with graf_handle() is of the *physical*
workstation. The AES already did the v_opnwk(), which you would have to
do yourself if you want to use the VDI before the AES is started (eg. in
an auto folder program).

In general, the handle that you pass to v_opnvwk() must always be of the
physical workstation, as returned by v_opnwk().

Hmm... I'm sure I remember a number of lectures a couple of years ago where
a lecturer explained in (painful) detail how to convert both head and tail
recursive functions into a while loop (using temporary variables).

I could be wrong though... I'll check my notes...

>sort of stack emulation. Comming to that point I am sure it's faster to and more
>memory efficient to use the build in stack mechanism of the 68000.

Well, if you can avoid using a stack and repeated function calls you are
going to have a lot of memory accesses (=slow) and branches (=lots of
hard to pipeline code [not relevent to Atari's, AFAIK]), and as for
spacial efficiency, you have to have a large stack, otherwise you'll
get stack overflow...

>However most standard examples of recursion in programming courses are examples
>of 'false' recursion. A recursive algoritm to calculate x! is a well know
>example of false recursion. Those false recursions ca be rewritten as a while
>loop.

Yes, I know that some textbooks give stupid examples, but I have a vague
memory of a proof that it can (theoretically) be done for all cases...

>But tree traversel routines realy do need recursion. Like routine that outputs
>the data stored in a binary tree in order:

Certainly no obvious way...

>Most games don't need those more complex data structures and routines to
>handele them.

Correct - except for 3d games. (BSP trees, for example)

I seem to remember that there was a bug in the first version of STOS
which caused problems with garbage collection. IIRC this has been fixed
since about 1990.

:-)

> collections.

Ok... all variables (except arrays) are dynamically allocated on a heap
and are global since STOS is not procedural. If you are doing a lot of
string manipulation, there *will* be a lot of garbage getting built up. You
can manually force a garbage collection at any time though to make sure
that it doesn't occur at a bad time.

STOS reserves its memory banks from the top of memory downwards (ie. bank
15 will always be near the end). So all constant data should be put in
higher banks and workspaces in lower banks if you are to be constantly
reserving and deleting banks. When you delete or reserve a bank, STOS
does a lot of work shifting the lower banks around...

The nice thing about banks is that you can use them for just about
anything (I have even used them for storing strings >65535 characters
long) and it is very easy to access them. Their best feature IMHO is that
you can use them for including binary data in your programs eliminating
all those horrible little files like you see with programs written in C. :)

I've never had any problem with garbage collections before, so he must
have been doing something wrong :)

As far as I know you are right. There is no point in opening a virtual workstation more than once. The benefit of doing v_opnwkk is that you can get hold of all the parameters of the workstation in one call.

>

>No, lets say they used a graphics library someone wrote. I think the amount of
>assembly code in Colonial Conquest is quit low because it runs on a TT and gets
>a great performance improvement from a screen
>accelerator.

But its assembly code, asm is asm, I use BASIC commands, I cant see
how you can say that something using assembler is in BASIC?, there has
to be a line somewhere, I mean you could say that because a BASIC
language was made in assembler then we are using assembler, you have
to stop somewhere,
a game that has a source listing that consists ONLY of that
launguages BASIC commands is a BASIC program, if you then load in
assembly routines from outside? then its no longer basic is it ?

> > Yes they do don't they...and IMHO are STILL as usefull as a glass
> > brick?

>Just as games are?

Games can give you a challenge, from the user point of view, what use
is a demo from a user point of view, a game can have an end result, a
high score table for instance, give the player a feeling of having
done something,
for a programmer, a game and a demo are on a par, probably more goes
into the demo, so the use of a demo is the challenge to program, the
use of a game is the same, but has a use for the user, and although I
didnt make it plain at the time, I did mean that a demo had no use to
the user...well IMHO :)

> > Then how do you know its great and how do you come to the conclusion

>Yes, reading this newgroup I understand all works fine on a falcon as long as
>you write your own keyboard routines. No problem for you, you will call it a

Wrong!....someone with a Falcon will have to back me up here, you can
write your own routines for joystick and keyboard, but you dont have
to, and unless its for some reason I dont know about then I cant think
why, possibly the guy who said this needed it because his routines
work after removing top and bottom borders, but for normal everyday
use, I can use STOS joystick and STOS keyboard commands and they will
work on the Falcon,

>upgrade (I would call it a cludge) and for a new piece of hardware you will have
>to wait untill someone cares to 'upgrade' your basic so you can use the new
>features, C however will produce working code for the new hardware.

dont understand the term "cludge" but can imagine, are you implying
that having your preffered programming launguage updated as a matter
of progress, to keep up with the times , you mean thats a cludge?

>And what about the new Atari clones? Go back to start and try again?

what about them, start what again, ALL tos versions can be supported,
according to the programmers of the generic fixer, the only reason
HADES etc was not included, was because he dident have access to one,
or contact with anyone who has one so he can set up the tables, as
soon as he has, then I wouldnt see a problem ?...but really? who would
want a game on such a machine ?

>No, I am saying that writing a program that manly exists of peeks, pokes and
>memory moves is almost the same as writing the code in assembly. Only in
>assemply you call peek and poke move.

yeagh, well almost dont hack it!...hehehe BASIC is BASIC, POKE is a
valid BASIC command, simple as that IMHO

> > BTW Hans..do you have an STe? or FM? Can I send you one of my games

I have made a lot of programs and been involved with a lot of people
making programs in STOS, and had thousands of STOS problems pass
through STOSSER diskzine, NEVER have I seen anyone have garbage
collection problems using STOS 2.6.....

>STOS reserves its memory banks from the top of memory downwards (ie. bank
>15 will always be near the end). So all constant data should be put in
>higher banks and workspaces in lower banks if you are to be constantly
>reserving and deleting banks. When you delete or reserve a bank, STOS
>does a lot of work shifting the lower banks around...

This is true, I can place chip music, sampled sound, quartet and lots
of other sounds in bank 15, then load anything i want from disk or hd
into other banks and the music/sound or whatever goes uninterupted,
caused quite a stir when i had a mod playing while loading text files
from disk....about 2 years ago :)

>
>The nice thing about banks is that you can use them for just about
>anything (I have even used them for storing strings >65535 characters

I load a text file of ANY size into a bank, even packed text using
any of the regular packers on the ATARI then format it into strings,
are get the starting point of each line and put that into a string,
the former is better for search,print routines etc :)

>long) and it is very easy to access them. Their best feature IMHO is that
>you can use them for including binary data in your programs eliminating
>all those horrible little files like you see with programs written in C. :)

A problem with STOS is not being able to re-dim an arrayed variable,
you can place all the data you would normally place into a variable or
dimmed variables into a bank, you can use double and triple dimmed
arrays in stos, ie DIM(A,X,XX), but I havent managed more, but by
using a bank, you can access data with as many branches as you like,
by using a bank, you can then erase the bank and thus free the memory,
unlike using a dimmed array?

Hang about!...the stos extensions are not "game libraries", they are
used in games yes, but are used as much in serious applications, look
at EXTRA, admittedly most commands are for games in some extensions,
but there are many others, look at all the disk copying, sector and
fingy stuff in misty,
there are many uses for commands that at first would seem to be games
orientated, I have maestro installed, never use it for sampled sound,
but do use the datacopying command as it handles uneven sized chunks
of memory?...

Yes, thats true. :-)

>>As I said - the lack of proper functions IS a limitation of STOS.
>
> Sorry Anthony, could you explain that last sentance, whats a proper
>function? and why does it limit STOS, although I am unsure of what you

Well, STOS doesn't have the ability to have a functions which are
effectively mini programs. They take input, and return output to
the main program. They can have local variables which cannot be
accessed from elsewhere, and may call other functions (including
itself)

eg. (this is C syntax, btw)

```
int function_1(int a,int b)
{
int c;

c=rand(); /* probably not right syntax, but dont flame me. I dont
use random numbers in C all that often... */
return (a+b+c);
}

main()
{
int d,e,f,g;

d=2;
e=3;

f=function_1(d,e);
/* f now equals 2 + 3 + some random number */
g=function_1(e,f);
/* g now equals 3 + f + some random number */
}
```

So, When in the main function it cannot access any varables called
a,b and c, but when it calls function_1(d,e) varables a and b are
created with the values currently held in d and e. c is created
as well. These new variables disappear when function_1 reaches the

'return' statement.

>speak, I have to say that after over 50 releases, I have never felt
>limited in any way ?

Yes, it is a known problem. If you are not aware of a particular
way of programming, then you do not realise the use of it. Because
you haven't used 'real' functions you are not aware of the power
they give. This is how recursion (not possible without functions
like above, or simulated using a stack) was introduced by one
lecturer.

I'm not saying that STOS is bad because of this 'missing' ability,
as it can be used to do anything you can do in other languages.
It is just a different way of programming.

> INSTIGATING THE STOS AWARENESS CAMPAIGN :)

hehehe.... ;-)

graf_handle() returns the physical workstation handle which the system
obtained from the v_opnwk() it issued on gem bootup.

When you open a virtual workstation with v_opnvwk() you pass the
physical handle into it which is overwritten with the virtual one (or
failure). Each virtual workstation has its own set of attributes.

The aes virtual handle is stored in the os header as of tos 1.4 up (I
think, no docs to hand).

>As far as I know you are right. There is no point in opening a virtual
>workstation more than once. The benefit of doing v_opnwkk is that you
>can get hold of all the parameters of the workstation in one call.

Trivial example ...

font1(h)
{
vst_alignment(h,0,0,..);
vst_color(h,RED);
vswr_mode(h,1);
vst_font(h,font1);
vst_point(h,point1,..);
}

font2(h)
{
vst_alignment(h,0,5,..);
vst_color(h,GREEN);
vswr_mode(h,2);
vst_font(h,font2);
vst_point(h,point2,..);
}

Use of one workstation means code like this...

loop {
font1(h);v_gtext(h);
font2(h);v_gtext(h);
}endloop;

Use of two workstations lets you ..
```

```
font1(h[0]);
font2(h[1]);
loop {
v_gtext(h[0]);
v_gtext(h[1]);
}endloop;
```

:-)

If you are truly VDI-phobic, you can do a surprising number of things without invoking VDI at all, including simple windowed text. For that you can create an F_TEXT OBJECT to use over and over; to print something, assign your string to the object, set ob_x and ob_y, then do an objc_draw. Besides not having to open a workstation to do this, it seems to simplify the management of clipping rectangles and such.

Once when I was struggling with VDI calls in the writing of my first full GEM app, I tried converting all output to AES object draws like this. It worked, but ran very slowly. I ended up biting the bullet and going back to VDI.

Screen memory? I am unsure what you mean here.

If you are refering to the memory where the current screen is stored (also
known as "video RAM"), applications do not allocate their own video RAM
anyway.

So what do you mean?

The effect you want is obtainable by using the "Install Application" option
in the GEM desktop (or the equivalent in an alternative desktop).

I get the feeling I must be missing the point of your idea, however. So please
correct me if my comments don't make any sense.

One thing that relates to this, however, is that when I have a shell script
that starts with, say, "#!/bin/tcsh", tcsh is not started when I double-click
on the item on the desktop. Instead, nothing happens (in the case of Thing)
or the file gets displayed to the screen (in the case of the GEM desktop).
Is this what you are referring to? And even if not, is there any way around
the problem?

IC magazine is a UK based fortnightly printed Atari publication. It is now in it's fifth issue and sold throughout Europe, and is soon to expand to cover the Oases/Omen platform.

Is there anything I, as editor, can do to help the programmers of the Atari community? If anyone out there wants to run a section, occassionally or regularly, that you feel would help fellore programmers, or if you have any other ideas as to how this newsletter could help Atari programmers, please contact me immediately.

Also please contact me if you'd like more info about the newsletter.

Please reply this message by email, and not through newsgroup messages.

Thanks for your time,
Matthew Townsend.

>it's a lot cheaper for me to get large amounts of data on that adres. I will
>send you my demo.

OK hopefully you have mangaed to have a good looksy at the game i
sent you..its all in basic and the actual source could be viewed in a
text editor, ie no machine code etc,

I got your demo done in BASIC, Yes definatly impressed, some of the
screens can easilly be done in other BASICs now...I say now, because I
think the one you sent me isnt recent, therefore is even more
impressive,
Loved the main menu...very nice,

The most impressive screen and the one that easilly stood out was the
circle scroller type demo, this is excellent, I have seen circle
scrollers in basic, but there where done with line, letters, eeerm
drawn using the line command, nothing however as impressive or as
smooth as yours,

All this is made even more impressive by the fact that the sound is
being replayed not by machine code routines but by your own routines
written in the program, thats something I could not do....but then
again dont need to :)

Yes impressed by your demo in BASIC...but it doesent alter my opinion
that STOS is the best BASIC for making games at this moment in time?:)

OK guys same question as I ask on a regular basis, just hopeing that
maybe some new blood in the group may be able to answer,

Has anyone got HIGHSOFT BASIC 2, can you send me some simple examples
and maybe..hopefully a command listing,
I have the copy from the atari world cover disk, but no commands, no
source,

Added question, how do you call the fileselctor from HSB2
how do you retrive the command line info

Is no one using this package yet ?

please please can you refrain from the usual answers, if i could
afford a manual, from highsoft then i would buy one, if i wanted gfa
then i would get it, what i am after, is what i am asking, that
simple?,

PLEASE can someone help <BIG smile>

Cheers.............!ynoT

Precisely. And in most cases, they take over the current video RAM, even if
they display nothing.

I am aware of the malloc for video RAM ...

>So what do you mean?

What I'm driving at is the ability to have data files treated exactly like
applications, but wihtout permitting them to access video RAM at all. IOW,
run as a background app using executable code loaded at startup - a TSR that
isn't permitted to access video RAM.

>The effect you want is obtainable by using the "Install Application" option
>in the GEM desktop (or the equivalent in an alternative desktop).

But not without video RAM access, so far as I have been able to determine.

>I get the feeling I must be missing the point of your idea, however. So

Uhmmmm. No. That's almost the opposite of what I have in mind.

>Is this what you are referring to? And even if not, is there any way around
>the problem?

If I knew a way around it, I'd be coding. <SIGH> I'm afraid my programming skills are limited to what I have seen in examples - I learned everything by typing in the programs in old Compuke, ST Log, Analog, etc., and modifying the code to see what happened.

I know how to install apps (I said so in the first message). What I want is
a TSR that won't bugger the screen display when I play a non-viewable file
(e.g., an audio, MIDI, io MOD file).

>Currently I have clickies installed for MODs, WAVs, FLIs, MPGs, JPGs, GIFs

>
>The main advantage is they're not resident programs, therefore they don't
>tie up memory!

Memory is NOT the problem. Response speed is a requirement, so a TSR is
preferable; and a completely non-video operation mode is desired.

Yea, ok, point taken. What I meant was that I only know of one C library that has useful things like sprite drawing, block copying etc. (excluding using the standard GEM/VDI libraries - who would use VDI for a scroller? Line-a, yes... [but incompatible :)]

We are, afterall talking about games programming, not demos, or apps or anything else, aren't we? :)

> there are many uses for commands that at first would seem to be games
>orientated, I have maestro installed, never use it for sampled sound,

>>It is just a different way of programming.
>
> yes I know what you mean now...but doesnt def? cover this?

Partially. It sort of provides this functionality, but not terribly well. Aren't you effectively limited to a one line function? (I've only used it once, so dont flame me if I'm wrong. :))

3601. fix for intout in common.h in gem library.

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-18 00:00:00 UTC
From: J.B.W.Webber@ukc.ac.uk
Message-ID: <1755@kiwi.ukc.ac.uk>
Source record: 8638

I have not been following this group for a while, so excuse me
if this has already been dealt with.

I think the following small change may be a fix for some gem calls
in the 32 bit mode, to the Atari gem library Patchlevel 31.

I was re-visiting some code I last compiled with the old Alcyon compiler,
and was trying it under gcc. Things were OK using -mshort,
but I was having problems I did not understand with 32 bit ints.

In particular, for the appended short test progran scn.c,
wind_get was not returning sensible values with 32 bit ints.

I moved a copy of wind_get into scn.c, and made the following small change
to common.h - after this wind_get returned sensible values in both modes.

```
#define _control (&_contrl[0])
#define _int_in (&_intin[0])
/*
#define _int_out ((int *)(&_intout[0]))
*/
#define _int_out (&_intout[0]) /* jbww@ukc.ac.uk 96_11 */
#define _addrin ((void **)(&_ptsin[0]))
#define _addrout ((void **)(&_ptsout[0]))
```

The impetus to get things working in 32 bit mode comes from the fact
that pml seems to have some problems with mshort - is this expected ?
In particular, exp breaks, that my code uses.

I got round this by compiling :
gcc -mshort -c graph.c ; gcc graph.o -lgem16 -lpml

but mow with the re-built gem.olb, the following works :
gcc graph.c -lgem -lpml

graph.c exercises open and close virtual workstation, sizer, fuller, mover,
closer; has a fairly lengthy evnt_multi section, and all seems to work OK
in both 16 and 32 bit modes now, with wind_get now OK.

The only change to graph.c from the Alcyon code, is to evnt_multi
where the two parameters following msgbuf become one :

```
unsigned long interval=(unsigned long)0; /* was two ints */
```

If you know of any other fixes I might need, I would be glad to have them.

cheers
beau webber

Here follows scn.c, to test the fix :

```
/*********************************************************************/
/* show screen facts J.B.W.Webber 96_11_16 */
/* gcc scn.c -lgem */
/* gcc -mshort scn.c -lgem16 */
/* needs intout fix to common.h */
/*********************************************************************/

/*********************************************************************/
/* INCLUDE FILES */
/*********************************************************************/

#include "stdio.h"

printf (" screen posn : %d %d \n", xdesk, ydesk);
printf (" screen size : %d %d \n", wdesk, hdesk);
}
```

3602. raster copy problems

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-18 00:00:00 UTC
From: J.B.W.Webber@ukc.ac.uk
Message-ID: <1756@kiwi.ukc.ac.uk>
Source record: 8639

I have been sucsessful in raster copying from one are of the screen
to another, using vro_cpyfm, by first defining a Memory Form Definition
Block for the screen, and the pxyarray defining the areas to be affects.

However what I want to do is copy in/out of linear memory, from/to the
screen.

My understanding is that I have to define a MFDB for the memory with
one single long line (and appropriate pxyarray), with mode 0, then call
vr_trnfm(handle, psrcMFDB, pdesMFDB)

What little docs I have implies that, copying from memory to screen,
the mode will be toggled and placed in the destination mode. This does not
happen. I realise I fail to understand what vr_trnfm is actually supposed to
do to what.

When I go on to call vro_cpyfm, to copy from memory (all set to 0x5555, to
give grey) to the screen, I get a single line where I expect to copy to,
and the top of the screen few rasters (in the menu bar) goes grey.

any help is appreciated.

cheers
beau webber

>a workstation (in most cases) and display something on the screen while
>running.

Well, you can already do this with the desktop. What you need are a set of "clickies", and you install these clickies to load and display/play files. You do that with the "Install Apllication" option under the Atari desktop and all replacement desktops have a similar (usually more poewrful) version.

Currently I have clickies installed for MODs, WAVs, FLIs, MPGs, JPGs, GIFs and TGAs. Works a treat :)

The main advantage is they're not resident programs, therefore they don't tie up memory!

Neil.

One thing to be concerned about, though, relates to backward compatibility. Even though many people these days are using NVDI and other replacements for the VDI, it is worth noting that TOS, by itself, has a static limit on the total number of workstation handles. I seem to recall from testing early on that it was around 20 or so. After this point the v_opnvwk() call will fail.

Using too many workstations in one program will make this limit apparent more quickly, especially if the user is multitasking.

I guess what you want are TSR's that work in the background & never send
data to the screen. You could load these from the Auto folder.

What you need is some way of 'defining' these in the desktop.inf file, so
that when you double click on a MOD/MIDI/WAV file, the desktop 'sends' the
file to the TSR.

Currently, defining applications in the desktop causes these to be
started; you don't want the usual messages you get with program startup.

You need functionality like the desktop's show/print function (but without
the dialog box). People have written alternative file viewers that
intercept the desktops show/print, you would need to do this & call the
TSR.

> beau webber

Hello.
When I started programming GEM I had the same problem, the
documentation I had implied that just putting NULL for the MFDB will
point it to the screen, it does, it also implies that just using the
name of an MFDB will copy to/from that MFDB. This caused crashes every
time. What I found out (eventually) is that the fd_addr field needs to
be set up in the MFDB as a pointer to memory. The easiest way I found to
do this is via malloc() (not Malloc()) the C version is much better.

This made vro_cpyfm() to work. (I will dig up the exact code an
post it at some point, email me for more info). This allows copying to
and from the screen as well as between areas of the screen, and MFDB's.

As to what vro_trnfm() does, my understanding is that given two
MFDB's (both of which must be of the same colour depth, i.e. nplanes
must be the same for both) it will convert the source form from device
specific into device independent and place it in the destination form,
or convert from device independent to device specific. (Again email me

for more info)

I hope this was of help, it took me months of playing around to get this to work. I could not find any doc's on programming the VDI, except the PROGEM series, well worth downloading & printing, if you get it from funet.fi they have postscript & TeX versions too. Make sure you get the source code as well....)

3609. Release tips

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-19 00:00:00 UTC
From: stosser@airtime.co.uk
Message-ID: <32919872.6653016@news.airtime.co.uk>
Source record: 8552

OK you make a program, a game or something serious (apologies to all the "serious" game players I just insulted) and its taken you months, or weeks or years or whatever,

Then what?

I mean the next step surely is to let as many people as possible know your program is available?, especially freeware programs as there is no other incentive bar feedback and recognition, but we all want our releases to be seen as far and wide as possible, so whats the best way of going about it?

INTERNET: OK letting everyone know on the net then hoping for word of mouth to spread, not brilliant as supposedly only ten percent of ATARI owners are on the internet?

MAGAZINES: This is the biggest way, however theres only one left, looking at issue one released at the atari shows, they do have a good policy re: reviewing, hopefully this means we will see reviews of recently released software rather than stuff a few years old, so send it to the magazine,

PD LIBRARIES: Sorry to say this, but IMHO most can not advertise your software, they will have there loyal band of customers, but?
However there are two PDL's in the UK , Goodmans and Floppyshop who send out updates of there catalouge to all there customers, so getting them to add your title to there collection will ensure a mail shot goes out to littraly thousands of ATARI users,

DISKMAGS: Send it to as many as you can, they will review it,there are many active diskmags in the UK, some available overseas, between them they will reach a heck of a lot of ATARI users,

WHAT ELSE?: Suggestions?.................

Cheers.............!ynoT

Not that I would be able to implement this or anything, but when I read Rich's proposal I thought it might be feasible through .XDD or .XIF MiNT extensions, in which case you would be able to bypass the desktop "install" altogether.

Comments?

Yves

> text editor, ie no machine code etc,

Yes, I did. Hacked around, wonderd why you use xbios calls to set the screen adress and wait for the vsync, installed a own vysync rout to study your timing, patched the screen code to look at screen updates. Discovered that some vsync calls were better programmed then others
lea 2(sp),sp ; 4 bytes, 8 cycles
against
addq.l #2,sp ; 2 bytes, 8 cycles
and many more.

Lets start with the games. I got from you heartland and I downloaded from your homepage Hero and Multi Pakman.

Lets start with the worst, multi pakman:
It won't work from harddisk. It leaves with some errorcodes lockingup your mouse. The game itself works in 2 vbls (I guess) and uses byte copys to move the screen (ie it moves with 8 pixels at a time). The sprites are 16x16 sprites. The playscreen is 12 sprites long and 6 sprites deep.
As the character is placed in the middle of the screen there are only 2 sprites visible beneath the character and 3 above. That makes the game play bad because a deadly obstacle comming from beneath needs only:
2(sprites) * 16(pixels) * 40(ms screenupdate)/8(pixels per update)=
160 milliseconde to kill you. Everytim I pick up a bonus the game stops, waiting for you to press the joystick button, that's realy annoying. (See for a well done multiplayer pacman game The Synergy Mega demo, it has a great game called crapman. But that one doesn't count in our quest for good basic games.)

Less worse is Hero, updating the screen every second vsync and again scrolling on byte level. Again it doesn't work from harddisk. Gameplay would improve if one could intterupt looking in a locker by pressing the fire button. Not realy much to say about this game.

The best game is heartland. It has some realy nice graphics! It also has the greatest playscreen of the three games. Again the screen updates every second vbl. Scrolling is again on byte level. A strange thing is that the timing gets far worse by the sound effects (like pling when you grap a coin. There is a small bug in the edge detection. If you are on a platform you can stand with one foot on air without falling. On the left side you will fall down before you have reached the end of the platform. Switching to 60 Hz makes the screen updates every 3th vsync making the movements 'blocky', but that could be expected.

A pity that no time was left for free moving sprites, but not bad for basic, it by far the best STOS game I have ever seen. (Please notice, still needs the word basic to indicate the comparison level.)

> I got your demo done in BASIC, Yes definatly impressed, some of the
> screens can easilly be done in other BASICs now...

Don't think so, only the intro is realy simple to do. I think your assembly subroutine library is useless to do any of the other screens. (Remember all screens work on plain ST's, so no DMA sound, no blitter, no hardware scrolling....)

> Loved the main menu...very nice,

Let's add three one-bitplane ghots, some rater-dots to eat, remove the scroller and some scanlines form top and bottom to get some extra processortime to handle ghosts, ending up with a pacman game that's absolutely impossible to do in STOS unless you write a special library doing the whole thing in assembly?

> All this is made even more impressive by the fact that the sound is
> being replayed not by machine code routines but by your own routines
> written in the program, thats something I could not do....but then
> again dont need to :)

Maybe you should, my routines are faster as the original play routines!

> Yes impressed by your demo in BASIC...but it doesent alter my opinion
> that STOS is the best BASIC for making games at this moment in
> time?:)

You still did't talk about GEM games done in STOS, did you?

Don't think we are finished yet! :-)

So there is a memory stack on which you can allocate a memory bank. AT the moment you free a memory bank all banks below is will be moved to fill the space?

Doesn't seem very usable for me. The only way to access such a bank would be by start (or end) relative adressing. But then I have very slow access on large blocks (>64k).

Secondly they would by unusable for holding the current screen.

> The nice thing about banks is that you can use them for just about
> anything (I have even used them for storing strings >65535 characters

You should tell this trick to Tony. He also has a lot of little files hanging arounf his program :-) . Maybe it's because most programmers are lazy people. It's too much work for them to put all the data in one large file or to include them directly in the program code. Both options can easily be done in both programming languages.

I wonder if it's fixed on a standard un-enhanced machine or not? I did
a similar thing once on my old 1 meg tos 1.2 jobby and got 120 odd
open before failure.

>Using too many workstations in one program will make this limit apparent
>more quickly, especially if the user is multitasking.

You have a point of course, even more so when most of the vdi source
code I've seen never even bothers to check for failure. The best
solution is to limit yourself to a very few workstations, used with a
little planning.

: preferable; and a completely non-video operation mode is desired.

I'm presently developing a 'Component Manager' that sounds similar to what you are looking for. Components are just the core part of an application, or simply libraries of functions. This if you want to make something like Media Player (MS Windows) then you have an app that looks for a certain class of component.

I'm not going to go into the gory details any further.

This won't be finished for quite a while, however. It is being developed primarily for MiNTOS, but is being written so that it can be configured to work with excatly the same functionality under MiNT+single TOS/MultiTOS.

Cheers,

James Cox

>I know how to install apps (I said so in the first message). What I want is
>a TSR that won't bugger the screen display when I play a non-viewable file
>(e.g., an audio, MIDI, io MOD file).

Oooops, I think I mis-understood you...

Anyway, it could be done as a TSR but it's a lot of hard work hacking into the OS to get it to use a different viewer depending on the file you're viewing.

Also, the TSR would freeze the desktop if you were only running a single-TOS, and changes like those you state would be very prone to changes in OS and perhaps even the desktop installed.

Perhaps a better method would be to install the audio players as a Desk Acc, then you could set the desktop to call it whenever you double-click on a WAV or MIDI file or whatever. I guess this would require a desktop that at least supports the AV protocol to some extent.

i.e. I can get ST-Guide to view a hypertext by double clicking on it from MAGXDESK, but I don't think it works for the TOS Desktop.

This would be a TSR (of sorts), it would be more compatible with OS' and replacement Desktops, and is virtually instant. The problem for a lot of people would be that a Desk Accessory to view/play and large number of file types would be the large memory requirements... Not a prob with a 14Mb Falcon, say, but definately a problem on a 4Mb one.

Let me guess: def is like #define in C. So you can say:
def plus(a,b) (a+b)
or
def arctan2(x,y) if(x<>0)then arctan(y/x)+pi*(x<0):else (pi/2)*sgn(y)
but this way you can not call a defined function within it self:
def fact(x) if(x=0)then 1:else fact(x-1)*x
to give a very bad example of a recursive function, but real recursive
functions are only needed in more complex situations.

>screen.

Ah, the docs start to get scarce round about here!

>My understanding is that I have to define a MFDB for the memory with
>one single long line

Can't remember exactly but it sounds right.

>(and appropriate pxyarray), with mode 0, then call
> vr_trnfm(handle, psrcMFDB, pdesMFDB)

You don't need to worry about this function. It's for converting
images to and from a standard format which VDI on all system
understands.

>What little docs I have implies that, copying from memory to screen,
>the mode will be toggled and placed in the destination mode. This does
>not happen. I realise I fail to understand what vr_trnfm is actually
>supposed to do to what.

I wrote some code which I've been using successfully for years (that's
why I can't remember the details). I'll post it here.

>When I go on to call vro_cpyfm, to copy from memory (all set to 0x5555, to
>give grey) to the screen, I get a single line where I expect to copy to,
>and the top of the screen few rasters (in the menu bar) goes grey.

The scheme I used works well and I've not had any reports of it
failing under any resolution. It'll be a uu-encoded zip.

No, you are wrong, if you enter youer code with toggle switches you have written the code in octal. Hex is something of the new generation. Try to hand compile 68k instructions in hex and octal. The latter is far easier. Same thing is true for a well known computer range with toggle switches: the pdp series from dec.

> won't be playing ATARI games !!

Wrong, people with such powerfull machines are still people playing games so now and then. Having overscan hardware is nothing special, nor expensive. I think we have found a important difference between UK and Holland and (even stronger) Germany. In the UK the ST is mostly
considered a game machine.

In germany the ST more used as a business computer, resulting in more high resolution applications and games (most high res games I know of come from Germany). A lot of modified hardware is in use or comming from germay (autoswitch overscan, high density modules, accelerators (like PAK030), medusa, hades (Switserland to be precise)).

And also on the software level you can see the difference:
Warp 9 in GB and the US against NVDI in Germany, Geneva against Magic when it comes to alternative multitasking environments (except for mint being a german product, made into the basis multi-TOS and now used on both sides), STOS and hisoft basic are typical for the english speaking Atari community, in Germany it's Gfa basic, or less common, Omikron basic. Reason for this difference? Germans don't wan't to use software in the english language with english manuals and most english speaking people can't read German at all, so German software is out of the question!

Where the french people come in this picture I don't know, but they are also pretty stubbourn and pround on their language, so I think there is an entire subculture of french Atari software.

An other example: in this english newgroup I got over the last four days about 60 messages, the other english Atari newgroups are not much better. In the Maus.sys.atari.software newgroup I got in the same time about 860 (yes more than eight hundred) messages.

Here in the Netherland we are somewhere between the enlish and german culture. Most of my utilities come from germany, so is my Basic, C -compiler and Assembler (although I also have de Lattice C compiler). I have got a German profibuch and a german Atari magazin.

So here ends some explanation about the different atari cultures.

> : And what about the new Atari clones? Go back to start and try
> again?
> Again very few and STOS programs work on 206 which is the
> current standard TOS in emulators eg Gemulator 96

Again the difference, the emulator is called Magic (Mac/PC) and is an complete
OS (second german emulator is TOS2WIN).

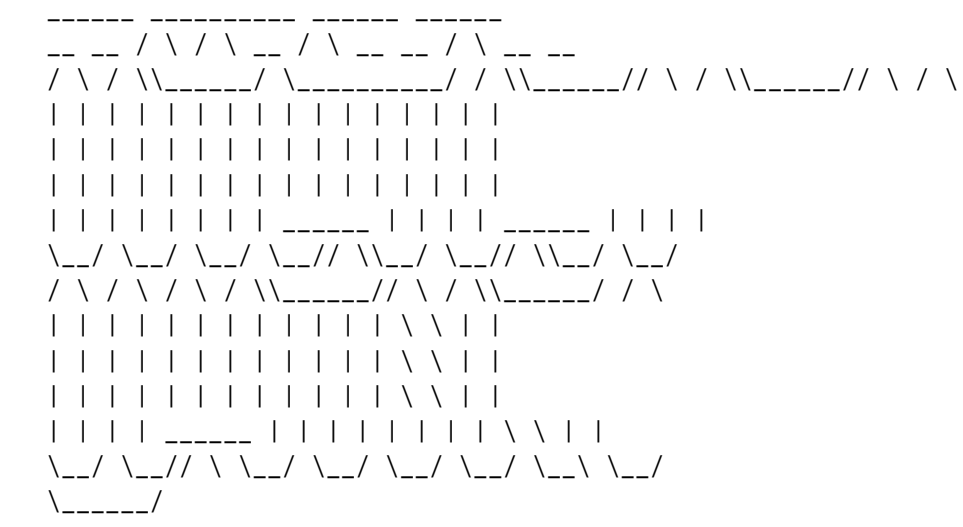
Thee Augean Stables Present:



The Atari Programmer's User Group

It's that time of the month again...

ICTARI 40 is now available on my web-page. Go to:

http://www.elis.demon.co.uk/ictari/ictari.htm

I've had a few new readers fill out the form on the web-page, from a variety of corners of the globe. No-one has mailed an article yet, though. Come on ! Filling out the form can pay off. One bloke added a comment that he didn't know of any Atari FORTRAN compilers. This is about the only area of Atari programming where I can call myself an expert, so I wrote a short article. Next month's issue might even come with a freeware FORTRAN compiler.

Due to other commitments, Peter Hibbs is stepping down as editor ! ICTARI 41 will be his last issue. It need not be the last *ever* issue. Suffice it to say, the job is up for grabs. If no more suitable candidates present themselves, I may consider having a go. Read my FORTRAN article, and see what you may be letting yourself in for ! All details are in the magazine.

Have Fun,
"Augeas"

> and tail recursive functions into a while loop (using temporary
> variables).

Yes, your teacher is right. Head only and tail only recursive function can be converted into while loops. But recursive functions making multiple calls to it self in the middle of the code, or just one in a loop like most directory scanners can not be converted into a while loop without the use of a sort of stack emulation.

> Correct - except for 3d games. (BSP trees, for example)

Never did 3d vector work, only a single 3d sphere spinning around 3 axis, sorting is not needed in that case. So I don't know about BSP trees. They might be needed to figure out which object has to be drawn first.

All you need is a just normal program that simply doesn't output to the screen.
That is easily done. No TSR is necessary.

>Currently, defining applications in the desktop causes these to be
>started; you don't want the usual messages you get with program startup.

You don't have to get the "usual messages". It's entirely just what messages
the programmer puts into the program. Just the same way as a TSR could have
various messages.

Using a TSR will not solve the problem.

Using a program that does not output to the screen, be it TSR or not, will solve
the problem.

>You need functionality like the desktop's show/print function (but without

>> Memory is NOT the problem. Response speed is a requirement, so a TSR is
>> preferable; and a completely non-video operation mode is desired.

I presume you have a hard disc drive, in which case software generally loads
quite quickly anyway.

Alternatively, you could just set all your file viewing software to load at
startup so that the desktop passes files to them by the AV protocol. This way
you don't have to wait for the software to load, since it is loaded all the time.

hmmm I may have lost this bit...but STOS keeps track of the banks,
you can erase delete restore reseve banks to your hearts content
throuout your program all you need to do is tell stos which bank your
data is in and it finds it,
You can say the current screen is in bank 7 (for example) and no
matter how many banks you erase or make, 1-6 or 8 to 15, stos will
allways know where bank 7 is, that IMHO is the clever bit,

so unpack 7 to physic , and stos would allways know where the data
was to unpack, no matter what

you can do a little extra yourself, variable=start(7) or end or
length etc is used a lot :)

> > that you can use them for including binary data in your programs

> > written in C. :)
>
>You should tell this trick to Tony. He also has a lot of little files hanging
>arounf his program :-) . Maybe it's because most programmers are lazy people.

hahahaha, a couple of things.....First: whats wrong with having lots
of files on disk? why would I need them all in one file, whats the
advantage of that? all are loaded into banks when the program boots
up,

>It's too much work for them to put all the data in one large file or to include
>them directly in the program code. Both options can easily be done in both
>programming languages.

You Kiddin?, about 3 mebbe 4 lines of code containing around a dozen
or so commands total and you have all your data in the one bank, but
why?

whats wrong with the way it is?

Getting something to work from hardisk, that was the same problem as getting something to work on a falcon, I do not own a hard drive, I don't even own a drive B?, at the time of making multipakman and HERO I did not even know anyone who owned a HD and my manual has no documentation re: hard drives, therefore at the time of making those games that don't work on a hd, I simply did not know how?

>mouse. The game itself works in 2 vbls (I guess) and uses byte copys to move the

Yes it does lock up the mouse on exit sometimes, I put that in the documentation, so if it was going to cause a problem then it was forewarned?, yes 2 vbls..so?

>screen (ie it moves with 8 pixels at a time). The sprites are 16x16 sprites. The
>playscreen is 12 sprites long and 6 sprites deep.

Correct ?

>As the character is placed in the middle of the screen there are only 2 sprites
>visible beneath the character and 3 above. That makes the game play bad because
>a deadly obstacle comming from beneath needs only:

ARRRGH BAD! what are you talking about!.. it makes the gameplay more difficult and more challenging, maybe I should have made the area bigger and the game slower for the underchallenged:)....the games not supposed to be easy, YOU are supposed to overcome such obstacles, the gameplayer should be able to figure out when the deathblocks will appear, its part of the gameplay, play play play, practice and overcome, surely that's the whole idea of a game ???????

>2(sprites) * 16(pixels) * 40(ms screenupdate)/8(pixels per update)=
>160 milliseconde to kill you. Everytim I pick up a bonus the game stops,
>waiting for you to press the joystick button, that's realy annoying. (See for a

So it would seem, I hold my hand up to this one,this has been mentioned before in reviews, and had I made another version then it would have been changed, its not bad programming IMHO but a bad choice of gameplay?...Yes?

>Less worse is Hero, updating the screen every second vsync and again scrolling
>on byte level. Again it doesn't work from harddisk. Gameplay would improve if
>one could intterupt looking in a locker by pressing the fire button. Not realy
>much to say about this game.

that's because you didn't play it enough...had you gone past the first three trainer type levels, you would have then got to the real meat, the extra baddies, the need to find and use explosives on doors, the need to find ammo for your gun and use it, the need to work out lots of things in order to finish the game, you would have also encountered lifts and teleporting doors, and a hell of a lot more, more graphics etc etc, end of level animations,
play the game fully before you announce to the world its not very good please ? :), what about the 20 odd different ways for the guy to die, the 300+ animations for the main sprite, the free moving baddies that don't rely on a simple left/right preset routine, what about a lot of other things?

>small bug in the edge detection. If you are on a platform you can stand with one
>foot on air without falling. On the left side you will fall down before you have

that's utter crap!, you make the game sound rediculous, it is nothing like you say, you cannot stand partly in mid air giving a false impression, that's utter and utter crap!

I am not even going to bother with the rest of this, you have done a hatchet job on the games, for example, you make a point of mentioning there are no free moving sprites in heartland, yet suprise suprise you don't mention there are loads of them in HERO...patheticly one sided just like the rest of your comments,

The thread is...STOS is the best BASIC programming language for making games in 1996, and I added C to the equation just to make the point,

You can pathetically rip my games apart all you like, you can prattle on about demos all you like, but you cannot show me a game written in BASIC other than STOS that's better than a STOS written game and therefore would be the proffered BASIC for someone to use right now,

I showed you...all you have shown is a demo ?

People who view the above games from a gameplayers point of view, like them, they neither know or care how many vbls something takes, they play the game, and they like it or don't, the majority like the above games, the magazines that review them absolutely love the games, not only top marks but awards as well, (bar Heartland that's awaiting its first review) <yikes>

In all the postings, you have yet to show me anything that even comes close to suggesting that today, there is anything better in BASIC for making games, you have talked a good game, but shown me no games ? and that's the thread, I showed you some STOS ones that you made a sad attempt to belittle, now you show me a top 1996 game made in BASIC

YOU CAN NOT HAHAHAHAHAHA

<STILL SMILEING>

Cheers.............!ynoT

Heartland had DMA sound on STE? (looped sample - 6kHz, so doesn't play on the
Falcon).

Blitter and hardware scrolling would make it incompatible with normal ST's,
which isn't what Tony wanted...

>Let's add three one-bitplane ghots, some rater-dots to eat, remove the scroller

No, but seriously, these are not a real issue due to the low numbers. Yes, there
are a couple (nethack, breakout, landmines, patience etc.) but these really are
not the sort of game we are talking about, are they?

>Don't think we are finished yet! :-)

3639. Volunteers to maintain Atari part of gawk?

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-20 00:00:00 UTC
From: michal@gortel.phys.ualberta.ca
Message-ID: <56vbkd$svs@pulp.ucs.ualberta.ca>
Source record: 8580

Does anybody out there would like to take over an Atari support
for gawk (be it under TOS or other OS, although Linux does not need
much support I guess :-). The next incominig release (soon) still
compiles, with glibc, and works on Atari/TOS. After that this will
be still likely the case, but you will be on your own if somebody
will not take over. :-) I will not have an access to a hardware
anymore.

The code nowadays is basically clean (it compiles correctly on
16, 32, 64, and possibly other widths, bit wide architectures).
Maitenance consists mostly of keeping an eye so the code will stay
that way :-) and watching Atari Makefiles, config and README's so
they will not drift too far away from the main body.

If there are any volunteers please contact Arnold Robins
(arnold@skeeve.atl.ga.us) and me (michal@ellpspace.math.ualberta.ca).

Thanks,
Michal

3640. Re: raster copy problems - some answers

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-20 00:00:00 UTC
From: J.B.W.Webber@ukc.ac.uk
Message-ID: <1761@kiwi.ukc.ac.uk>
Source record: 8581

I think I have some answers myself, about my questions regarding
the raster operations on the ST.

I have looked in the original Digital Research docs, in the Prospero C
and Pascal VDI binding books, and in the ProGem docs, as well as
experimenting a bit. I am using gcc, gem lib patchlevel 31, and TOS 2.06.

vro_cpyfm :

What the books say is that if the size of the xypixel map is not the
same for source and destination, then the size of the source is used.
What I see is that size and shape must be the same.

i.e. pxyarray[6] pxyarray[7] are only used to find the smallest xy
coordinate as the starting point; size and shape come from the
source coordinates. Please correct me if you think I am wrong.
I can see nothing in the gem lib that could cause this behaviour.

Thus it is not possible to copy from a vector of bits to a rectangle
on the screen. What you must have is a map of bits, layed out in
the same shape as the screen bits, padded out so that each scan line
starts on a 16bit word boundary.
i.e for a pattern that is to be 52 bits wide must be padded out to 64 bits,
before starting with the next scan line.

See below for some code that generates a simple pattern, pads it out
to be in a form suitable for vro_cpyfm to copy to the screen.
To follow a vro_cpyfm copy from screen there is then some code to
convert back to a packed bit pattern. This example code calls no gem
functions, so it does not need to be linked to any libraries, just
displays the patterns in hex.

Thus to copy from memory to the screen, pxyarray should contain
something like :

0,0
width-1,height-1
Xposn,Yposn
Xposn+(width-1),Yposn+(height-1)

the last line could be Xposn+(height-1), Yposn+(width-1) and it would
make no difference.

In addition , the width in words (widthw) must be written to the MFDB[5], and
widthw*16 to MFDB[3], height to MFDB[4], and the long address
pointing to the data to MFBD[0],[1].

For a screen MFDB all that is needed is to write 0,0 to MFDB[0],[1], and
the ST fills in the rest.

vr_trnfm

I gather that Atari standard B+W screen is the same as the GEM
'standard form'. Perhaps that is why so-far I have seen no change to
any Memory Form Data Block (or the data it is pointing to)
after a call to vr_trnfm. At the very least I expect the mode bit to
toggle. If the src and dest are set to be the same, it should read
a MFDB, modify it, and write it back. Puzzled.
Any way, there seems to be no need to use it as long as I stick to
high res screens.

I can now copy between packed bitmaps and the screen OK.

Hope someone else finds this useful.

cheers

Hmmm! Been on those soft drugs then? On what measure do you think that
STOS is better than any of the above? You use different programming
languages to give different results. For instance STOS is perfect for
games which make small demands on the CPU, or to cobble things together
quickly. GFA is perfect for making easy to read, and maintain programs.
Hisoft (not Highsoft) is better for more traditional basic programming. C
is for hacky programs that work very fast.

: Anyone want to prove otherwise ?
Set your benchmark. What about a Scrolling background, with a number of
sprites? More important than the programming language is the programmer.
For instance I have used all tha languages you mention except Hisoft. I
use assembly to put the speed, or tricky bits in. Not usually because I
cannot do the task in GFA for instance but for two more constructive reasons.
1. When 'inline'd it works at the same speed in the interpreter as in the
compiled version.
2. It is often easier to program graphics routines in assembly than to
try and get the programming language up to speed on that task.

: I will put STOS games on a head to head with any others, and win...
That is why most commercial games were written in STOS is it? I have made
programs that people could not tell the language (the hallmark of good
programming), I defy a STOS programmer to hide all traces that it is a
STOS program.

: Who wants to see a game with a green backdrop and scroll
: bars?...hahaha GEM Phoooey
Tis not necessary to have these. When you learn how to use the other
languages better, you wont have to have these bars.

: C'mon you programmers, lets see you make a decent game NOW
I also did not thank that programming languages provided gameplay.

: *****************
: This has been a "lets liven up
: the newsgroup posting", Did it
: work ?
: *****************
More considered comment on the deficiencies of the above programming
languages may have been more appropriate.

Tony, you're kidding, right? Maybe you call it something different in
the UK. A toggle switch is a simple on-off flip switch. What is be
referred to is the old monsters that had 8 switches in a row. By
turning various switches on or off you directly programmed in binary. I
don't know exactly how the program was saved, but these things were very
large. About the size of a medium copier. I saw one of these a few
years ago and almost bought for the sake of nostalgia. But my garage
was already full. See ya.....................j

Go to the library and find an old Byte magazine or possibly Popular
Electronics - look for an IMSAI or SWTPC DIY computer project and you'll
find the front panel has an array of switches. Those are actually used to
enter the program code in binary; set the 8 or 16 switches, hit the "enter"
switch and step to the next memory address; repeat until the program is
entered. Then set the start address in binary on the switches, hit "go" and
watch it run.

No, we were talking about my demo. Tony was saying some of the effects could
easily done with a modern basic. I still am very curious which effects cab easy
be done with a modern basic without useing above mentioned features.

> Well, there are single bitplane sprite routines, but not having seen
> the demo you are referring to, I cannot comment any further....

The single bitplae routines are not the problem. It's generating the playfield.
That cannot be done with STOS basic (nor with Gfa basic) without writing a
special routine which does the trick.

>> You still did't talk about GEM games done in STOS, did you?

Maybe for the english speaking Atari community. As I pointed out the German
speaking part has different standards

> but these really are not the sort of game we are talking about, are
> they?

At the beginning of the thread Tony made it very clear game programming is game
programming. It was a clear statement he said. When we are starting to rule out
certain games the statement has to be changed. Maybe
something like:
STOS basic is the best basic for writing arcade games if you are english
speaking and only want to write games for the ST and STe.

> was to unpack, no matter what

No, no, I want to have the physic screen in one of the banks. This started with someone claiming STOS mamory banks where great thing, no need to malloc memory and so on. One of the things memory is used for is to hold the screen data. But from the stories I heard about those memory banks I undestand they are moved by the languages memory manager around in memory. This means you can't keep the adresses of much needed data in a variable, but you always have to tell wich bank you need on on which adress in the bank the data is.

>> It's too much work for them to put all the data in one large file or

>
> whats wrong with the way it is?

Well, you had the lame excuse that some of your software wouldn't work because you hadn't one? Put all the data in the program file, or in one big data file that has to be in the current directory and you don't have to bother where your files are located (on disk, harddisk, networkdrive or maybe even on tape). As long as you can open a file in the current directory (something like open(#1,"game.dat)) and you don't have to bother where your data is allocated or how exactly to handle the device. Your OS will solve problems like that for you.

Other reasons: smaller risk of loosing data, faster copying, less slack space on the medium, better compressable.

So why not?

Hans Wessels

You can't use XBIOS calls in STOS basic? And the rest of the OS, it's forbidden playgroud too?

> Getting something to work from hardisk, that was the same problem as
> getting something to work on a falcon, I do not own a hard drive, I

Lame excuse. Loading from disk is exactly the same as loading from harddisk (from the OS's viewpoint). Just don't insist of getting data from drive a and don't use a absolute path. An other solution was discussed somewhere else.

> So it would seem, I hold my hand up to this one,this has been
> mentioned before in reviews, and had I made another version then it
> would have been changed, its not bad programming IMHO but a bad
> choice of gameplay?...Yes?

A bad choise of gameplay enforced by the limitations of the used language?

>> small bug in the edge detection. If you are on a platform you can
>> stand with
> one
>> foot on air without falling. On the left side you will fall down
>> before you
> have
>
> that's utter crap!, you make the game sound rediculous, it is nothing
> like you say, you cannot stand partly in mid air giving a false
> impression, that's utter and utter crap!

It's true: Let me draw it in ASCII

```
-- --
(..) (..)
/( )\ /( )\ <-- The playing sprite
AA AA <-- Right foot is not
############ standing on the platform
^ platform and the sprite doesn't fall down
\
- the left food isn't standing on the platform, the
sprite does fall down.
```

I am calling the fact that the sprite does fall down in the left situation a bug in the program. It shouldn't be that way.

> The thread is...STOS is the best BASIC programming language for
> making games in 1996, and I added C to the equation just to make the
> point,

Still you didn't mention anything about writing GEM games in STOS. So I say:
STOS basic is totally useless for writing GEM games and so it is NOT the best
basic for making games in 1996. So either Gfa, Hisoft or Omikron basic is the
best basic for making games, because those basics allow you to write GEM games.

Likely my fault, I talk in shorthand, too. <G>

>Anyway, it could be done as a TSR but it's a lot of hard work hacking into
>the OS to get it to use a different viewer depending on the file you're
>viewing.

Since I'm not doing the work, that doesn't bother me. <G>

>Also, the TSR would freeze the desktop if you were only running single-TOS,
>and changes like those you state would be very prone to changes in OS and
>perhaps even the desktop installed.

But this does.

>Perhaps a better method would be to install the audio players as a DA,
>then you could set the desktop to call it whenever you double-click on a
>WAV or MIDI file or whatever. I guess this would require a desktop that at
>least supports the AV protocol to some extent.

It's a reasonable thought. I may have an extension of that idea in mind -
see below.

>i.e. I can get ST-Guide to view a hypertext by double clicking on it from
> MAGXDESK, but I don't think it works for the TOS Desktop.

Actually, I think that does work in TOS 1.2 - that's the earliest TOS I have
ATM.

>This would be a TSR (of sorts), it would be more compatible with OS' and
>replacement Desktops, and is virtually instant. The problem for a lot of
>people would be that a Desk Accessory to view/play and large number of file
>types would be the large memory requirements... Not a prob with a 14Mb
>Falcon, say, but definately a problem on a 4Mb one.

What about a "shell" DA that identifies the file type by the extension
(making proper filenames a necessity!), then looks in a little config file
or just in the EXT folder, perhaps, and loads/runs the proper player?
Something like CPXes - actually, CPXes might be able to do the job; I don't

know how to communicate with 'em, but that's not my problem directly anyhow, not yet, at least.

Biggest problem I can see though is the malloc problem - it would be best if the player EXT could malloc as much as it needs and then free it when done, but I don't know if that works in a DA, either.

> see what I mean :)

I am not talking of PC's, I am talking about Atari power users. People with processor accelerators, TT's (or better), enhanced hardware. On TOS parties only 16MHz or fatser machines are allowed to connect to the MIDIMAZE network. This to speed up the game. We used to get enough machines for a good game.

There aren't much games specially written for TT's and better so it's either palying GEM games and (patched) ST games or playing no games. Gem games are nice because you can play them while the C compiler is working it's way through your multi-megabyte C source.

> Dunno about Highsoft, I am having real trouble finding more than a
> couple of users, but STOS (although I am biased) is used widely, its
> very common and every single PDL is packed with STOS written programs,

Again, wrong, you are seeing the english speaking Atari world. Asuming a PDL is some sort of public domain disk lets have a look a the ST Computer public domain pages (ST computer is a German Magazine):

- Don't wory, be happy!, Gem version of ludo
- Nanjing, Gem game (Acc or program)
- Sokoban, Gem version of sokoban.
- Invers, Gem game..

and so on..

The april 1995 edition has ten new disks, 4 of them containing Gem games, I am realy wondering how much of those games where written in STOS (none I think), Gfa Basic, C and assembly, can't see though, it isn't mentioned.

> Is Omikron still a live product, I presumed it was an old BASIC?

Hmm, there is someone telling STOS is the best basic for game programming, doesn't know what other basics are doing! Well let me inform you: The newst Omikron basic is vs 5.02 from 19-05-1996. It's now running on the MagiC OS too (Mgic, MagiC Mac, MagiC PC). So you can program your games on those OS's and

they will work on those OS's (unless you choose to use computer specific features, like DMA sound, our direct acces to special hardware registers..).

What about STOS updates? Which is the old basic?

> And I take it all the messages are in German?....personally I would

Ofcourse, it's a German newsgroup. Stunning, a bunch of german Atari users are cabable of producing more messages than the english speaking 'the rest of the world'.

>>Again the difference, the emulator is called Magic (Mac/PC) and is
>>an complete OS (second german emulator is TOS2WIN).
> eh? I do not understand your last comment? Gemulator can use TOS 206
> and in fact is reccomended, and STOS does work under Gemulator on a
> PC

Gemulator is not THE ST emulator. You have Magic Mac for emulating an Atari on a (power) Mac and Magic PC for emulting an Atari on the PC. Those emulators are comming with the MagiC OS (in fact the emulator can boot from any ST rom image, but that is not documented).

Bye, Hans Wessels

3649. Das Profibuch

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-20 00:00:00 UTC
From: Hans Wessels <mr_ni@mbh.org>

Source record: 8590

Tony Greenwood wrote:

> sorry? profibuch ?

Yes, the holy Atari bible. C.a. 1500 pages Atari knowledge. Let me give the index:

Part I - TOS - Atari's OS
Chapter 1: BIOS and XBIOS
Chapter 2: GEMDOS
Chapter 3: VDI-OS routines
Chapter 4: AES-OS routines
Chapter 5: X-Control
Chapter 6: Programming and Userinterface guidelines
Part II - The ST harware
Chapter 1: The CPU
Chapter 2: The Graphics System
Chapter 3: The Soundgenerator
Chapter 4: The MFP 68901
Chapter 5: The serial port
Chapter 6: The parallel port
Chapter 7: The ACIA's in the ST
Chapter 8: The Floppydisk interface
Chapter 9: The ACSI port
Part III - The TT hardware
Chapter 1: The MC68030
Chapter 2: The MC68882
Chapter 3: ROM and RAM in the TT
Chapter 4: The TT videocontroller
Chapter 5: Und weil's so schoen war - Another MFP in the TT
Chapter 6: The TT SCSI port
Chapter 7: The SCC
Chapter 8: The VME-bus in the TT/Mega STE
Chapter 9: The system control unit in the TT/Mega STE
Chapter 10: The Clockchip in the TT
Chapter 11: Other things about the TT
Appendix:
A: BIOS, XBIOS and GEMDOS error numbers
B: Important OS structures
C: Keyboard Scancodes
D: ASCII table
E: System font
F: Patch variables in AHDI
G: the IMG format for Rasterpictures
H: Short intro into C

I: Usefull tools for programmers
J: The STE hardware
K: The realtime clock of the MEGA ST(E)
L: The MC68881 coprocessor in the MEGA ST(E)
M: Short overview of the hardware registers
N: The chip pinnings
O: Further reading

It tells you all you want to know about your Atari. How to do Gem programming, the serveral OS routines, but also how to program the floppydisc controller or the serial port. There are even schematics of the hardware implementation of the serveral IO ports.

It's usefull for programmers who want to do their programs in Gem, but also for those who want to write a DMA disk routine or do hardware modifications.

>: games, I would also say that for making games it kicks the arse out of
>: C....

>Hmmm! Been on those soft drugs then? On what measure do you think that

No, cheap wine, probably has the same effect, is cheaper and legal
:))

>STOS is better than any of the above? You use different programming

"what measure"? thats easy, from what I can see ? simple as that! I
can see good STOS written games, cant see sod all from anyone else in
BASIC ?

>languages to give different results. For instance STOS is perfect for
>games which make small demands on the CPU, or to cobble things together

ho dear?...sorry but you really must check out something thats made
in STOS thats been upgraded, ie 1996 STOS, the rest of your posting is
I am sure based on old STOS :(....I would be gald to send you
something that will blow your socks off,

STOS HAS BEEN UPGRADED or havent you been following the thread?

>quickly. GFA is perfect for making easy to read, and maintain programs.
>Hisoft (not Highsoft) is better for more traditional basic programming. C
>is for hacky programs that work very fast.

Yes I would probably agree, indeed if you look at other postings you
will see I am trying to find out as much as I can about highsoft
basic, I never said STOS was the best BASIC, the point I am making is
that, if someone wants to make a good game NOW, in BASIC or C, then I
would say that STOS is the best IMHO :), (any many others<G>)

>: Anyone want to prove otherwise ?
>Set your benchmark. What about a Scrolling background, with a number of

Ho hello, someone with the balls to put there program where there
mouth is hey, well go for it!, tell me what you can do in BASIC for a
game, and I will show you better in STOS...do it! or come back and
tell us all why not ?

>sprites? More important than the programming language is the programmer.

hahahaha done it, go to my page and check some of my software, how
about a jigsaw type puzzle made out of a smooth playing video,*.VID

file, split the video up into 30 smaller parts with each part playing
at excatly the same speed and independantly, now give the user the
control over any part, to pick up and drop, but keep the video he
picks up, ie the 30th peice playing,

I have released at least 4 games with very large play areas
consisting of 8 way scrolling and sprites, independant of each other
have a look.....

>For instance I have used all tha languages you mention except Hisoft. I
>use assembly to put the speed, or tricky bits in. Not usually because I

The thread is "best BASIC for gamemaking" not assembly ? tut tut

>cannot do the task in GFA for instance but for two more constructive reasons.
>1. When 'inline'd it works at the same speed in the interpreter as in the
>compiled version.

eeerm SO WHAT ? I can run a STOS program from within STOS at exactly
the same speed as compiled?

>2. It is often easier to program graphics routines in assembly than to
>try and get the programming language up to speed on that task.

Again the thread is "best BASIC" not best language, only an idiot
would say STOS or any other BASIC is better than assmebler, please
stop moving the goalposts ?

>: I will put STOS games on a head to head with any others, and win...

>That is why most commercial games were written in STOS is it? I have made

No, the reason STOS never made the commercial market was because when
the ATARI commercial market was in a good position, STOS was crap,
the whole point if you have been following this thread, is that STOS
is the best BASIC for game making today...but yet again you try to
move the goalposts ?

>programs that people could not tell the language (the hallmark of good
>programming), I defy a STOS programmer to hide all traces that it is a
>STOS program.

ok try H.E.R.O. it fooled the hell out of the magazines when it was
released, enough that when i told them it was STOS they even wrote an
article saying how suprised they where, GET REAL, get in to 1996, you
are still talking about STOS of old, suppose you are still seeing the
STOS fade and the crappy mouse pointer and MBK files, Sheeeesh :(
Since HERO I have stopped trying to hide the fact that its STOS, what
difference do you think it makes to the person playing the game,
So a sign of a good programmer is the ability to hide its language,
WHY? thats a daft thing to say ?

>: Who wants to see a game with a green backdrop and scroll
>: bars?...hahaha GEM Phoooey

>Tis not necessary to have these. When you learn how to use the other
>languages better, you wont have to have these bars.

Tis was a Jest Sire :)

>: C'mon you programmers, lets see you make a decent game NOW
>I also did not thank that programming languages provided gameplay.

eh?

>: **********
>: This has been a "lets liven up
>: the newsgroup posting", Did it
>: work ?
>: **********
>More considered comment on the deficiencies of the above programming
>languages may have been more appropriate.

I have absoloutly no idea what that last comment meant, can you
explain please ?

>: Cheers.....!ynoT
>
>Arrrgh. Please tell me that you do not sign your name backwards, this was
>just a freak key selection. Why? Get you n-key rollover sorted.

waddaya mean why?.....hahahaha.....why not?....ynoT..GEDDIT!

>Atari Enthusiast, with a burned computer. Alas. GFA is the bast anyway!

NOT FOR GAME MAKING ITS NOT, or would you like to prove otherwise, or
are you all talk as well ??????
I can show you a game made recently in STOS that is not fantastic,
but is reasonably good, You show me something

All these people quick to debate the point that STOS is the best
BASIC for making games, yet not one of you can show me ZZZZzzzzzz

ALL TALK THE LOT OF YA! HAHAHAHAHAHAH :)

<Serious Smile>

Cheers.....!ynoT

Hi all,

I am having a problem with a program I have written, on an Atari STfm (1/2 meg) it crashes at a seemingly random point for no reason I can find. The error is two bombs : bus error, poke or peek possibly wrong. The same thing does not happen on an Atari STe. Is there a reason for this error that I can program around? Any help or ideas would be much appreciated. Cheers

Dan Jones.

>what a "toggle switch" is ? because I dont?

well, you should do really. A toggle switch is just an on/off switch.
(it 'toggles' between two states). A light switch is a toggle switch.

In this context, they mean really old computers (like the ones built
here with the really clever naming scheme... Manchester Mk1, Mk2...)
which were programmed by setting the binary values in the memory
directly by entering the numbers into a bank of toggle switches...
A tiny bit more complex to program that STOS... :)

>you hadn't one? Put all the data in the program file, or in one big data file

lame! lame, you call me lame when you cannot even back up anything
you are trying to say?, I made a statement and backed it up with
software to prove it, you have done nothing but talk, ho and show me a
demo that had nothing to do with making games, show me something that
has something to do with the thread, THEN and only THEN, may you
resort to insulting me

my excuse was that I did not have one, ie a hd, or have any
documentation and no way of getting it, OK!

>that has to be in the current directory and you don't have to bother where your
>files are located (on disk, harddisk, networkdrive or maybe even on tape). As

You put heartland on your hardisk and it worked, so you know that I
already work like this, its called learning, no one makes a something
perfect first time, heartland is my latest release and works from hard
drive, and we all know that you already tested it, so why try to look
clever telling me how to do something that you know I have done
already ???????????

>Other reasons: smaller risk of loosing data, faster copying, less slack space
>on the medium, better compressable.

bollox, your doing it again...talkin bollox, no one ever lost data
from any of my games, theres no good reason tyo put all the files into
one file, theres no reason why not to have them anywhere I want ?

AGAIN the person playing the game and enjoying himself, is not going
to worry about how the disk is made up,

Wouldn't it be nice if the demo you sent me did not have loads of
different programs on it, then your explanation would not have looked

so silly, had you practised what you preach ????

Hang on, didn't I just answer this thread, you are duping your
posting Hans :)

>(from the OS's viewpoint). Just don't insist of getting data from drive a and
>don't use a absolute path. An other solution was discussed somewhere else.

You already know I can do this, because you ran heartland from your
hard drive, so please stop trying to show off,
BTW I also said I had no documentation no hd and no contacts with
one, I have since learnt, or are you suggesting that everyone that
releases something should make it perfect on the first go ?

> > would have been changed, its not bad programming IMHO but a bad
> > choice of gameplay?...Yes?
>
>A bad choise of gameplay enforced by the limitations of the used language?

Ho dear, why make statements you cannot back up ?
I made a decision to stop the game, I could have let player two
continue, but I wanted both players to see what decision was being
made, ie: wether they where going to lose something from the other
players choice, it was my descision, NOT a limitation?

> > that's utter crap!, you make the game sound rediculous, it is nothing

> - the left food isn't standing on the platform, the
> sprite does fall down.

draw all you want, you are trying to tell everyone that the sprite in heartland gives a false sense of being able to stand in mid air and not fall when it should, and actually stands somewhere but falls, that is an utter falsehood, it is nothing like you say, why do you feel the need to attack sofware like this?

Has anyone played Heartland, would you say it is bad detection, is it really as crap as Hans wants everyone to believe ? I tell you what Hans, if Heartland is that bad, if its as sad as you are trying to make out, then its time for me to pack up,

>I am calling the fact that the sprite does fall down in the left
>situation a bug in the program. It shouldn't be that way.

sheeesh .it does not happen the way you are making it out, I dont mind critism at all,in fact I welcome the feedback, it helps to make the next game better, but you are trying to make out that the sprite when on the right hangs in mid air, and when left it falls off when it should not,

>Still you didn't mention anything about writing GEM games in STOS. So I say:

Thats because it is irrelevant,

>STOS basic is totally useless for writing GEM games and so it is NOT the best

Ho I agree totally, STOS can NOT access GEM, even though you state in this newsgroup that I use GEM calls ?,

>basic for making games in 1996. So either Gfa, Hisoft or Omikron basic is the
>best basic for making games, because those basics allow you to write GEM games.

hahahahahahaha yes I agree anything is better than STOS for making GEM games.....but who the F wants a GEM game ????

I can show you a good game written in 1996 in STOS BASIC, you show me one in GFA, HISOFT or OMIKRON and you win, in other words back up your statement, I DID ?

>Hi All, esp Tony :)

HEHE What did I do ? :))

>I was wondering if STOS is still available commercially - if so, where from.
>Anyone in the UK ?

OK, STOS is no longer supported by the original authors, they are
busy making Klick'n'Play and followups on the PC, the people who own
the selling rights to STOS have absoloutly no InteresT in the product
and according to an email I recieved from them, they say they would
not be interested in anything to do with STOS or be able to find the
time to deal with any matters arrising from STOS , That was a response
after I asked if anyone would mind me sending out copies FREE of
charge and unchanged, so..?

STOS was released on a cover disk ST Format? cant recall the issue,
but its in the STOS.FAQ, Ad-Lib BBS (Sysop Frank Charlton ex ST Format
STOS Answers), they have a file site that contains all the softwrae
from ex cover disks, so you should be able to get a copy from there?

Otherwise such publications as MicroMart usually have adverts for
used ATARI stuff :)

BEFORE anyone jumps in with there size nines!..STOS is supported by
independant software developers, there is no need for the original
authors, STOS was made in such a way that it is simple for extra
commands to be added onto the launguage, there are now many such
upgrades, including Falcon specific stuff :)

Please see the STOS FAQ for more info :)

Cheers.............!ynoT

I think it would be quite easy - if you make use of existing software.

There was a program on an ST-Format coverdisk called 'what-is' IIRC, which identifies a file (by reading the header - not just the file extension) and introduced a protocol for programs to comunicate with it.

You could write a simple little application to replace the standard viewer which asked What-Is what the file was, and then called the appropriate external program - eg. Midifp for .MID, Play-avr for .AVR etc. If 'What-is' returns 'unknown file' simply display a dialogue informing the user that it is not a recognised file, asking the user what to do (display as text, abandon, select viewer application...)

These programs do not write to the screen (well, they may do, but it is relevent - not just the contents of the file) - I dont see the problem here. There is no real need for What-is, but this just makes it a bit more sophisticated.

Ideally, I think replacement desktops should also understand this protocol so that there was no need for the above app - just interigate What-Is directly. This would improve the install application facilities of these desktops.

Yes I was trying to say that games made on lower end machines, will
look sad on higher end machines, does that make it a little more clear
?:), I was including my software, as well as any other made on a bog
standard ST, people with power machines should expect more?

>There aren't much games specially written for TT's and better so it's either
>palying GEM games and (patched) ST games or playing no games. Gem games are nice
>because you can play them while the C compiler is working it's way through your
>multi-megabyte C source.

OK, I will bow to your experience on this, I neither own or have
access to anything other than a standard STe, it was an assumption
that someone upgrading there machine would not want software from
there old machines they obviously wanted to get away from, it would
seem they have no choice?

> > Dunno about Highsoft, I am having real trouble finding more than a

Tony, XBIOS isn't part of GEM - thats AES/VDI. The Xbios *can* be accessed from STOS via the 'trap' command (trap 14,...). Despite this, I doubt that Tony is the one using Xbios - it is either extensions (eg my Falcon extension sometimes uses this to change resolution - dependent on the STOS programmers wishes, of course) or the original STOS commands.

It was the fact that it required the program to be in the root directory - not on floppy disk - that caused the problems. As you are unlikely to keep a disk-sized game in a sub-directory on a floppy disk, this problem was not encountered on floppy based systems.

(try running Hero from the root directory, and it will work from HD...)

>>(from the OS's viewpoint). Just don't insist of getting data from drive a and

hehehe.... yes, a simple leading \ is all that problem was... And how many HD owners made Tony aware of this limitation?

> Has anyone played Heartland, would you say it is bad detection, is it
>really as crap as Hans wants everyone to believe ? I tell you what

Nope. I would say that heartland is a great game, and I didn't notice
any such problems.

>Hans, if Heartland is that bad, if its as sad as you are trying to
>make out, then its time for me to pack up,

Nope. Judging by the comments of gamers in c.s.a.st when Heartland was
released, I would say that Hans is in the minority on this one...

>>basic for making games in 1996. So either Gfa, Hisoft or Omikron basic is the
>>best basic for making games, because those basics allow you to write GEM games.
>
> hahahahahahaha yes I agree anything is better than STOS for making
>GEM games.....but who the F wants a GEM game ????

Yes - would anyone here honestly say that the best game they ever played
was written in GEM? If not, then surely a programming language which doesn't
support GEM may still be the best for games, even though it doesn't support
it?

> I can show you a good game written in 1996 in STOS BASIC, you show me
>one in GFA, HISOFT or OMIKRON and you win, in other words back up your

The only real problem with that is that it requires MiNT. I'm looking for a
way to extend singleTOS - MiNT has so many incompatabilities that it totally
defeats the purpose of having it installed for me.

The problem is that writing to the screen is NOT relevant. IF there's a
problem with the data file, I'd rather have no results at all, or a log file
written out - the whole purpose here is to play data files WITHOUT screen
display.

Need input!

We can't troubleshoot unless you tell us:

(a) what language is it written in;

(b) how much RAM does it allocate to itself;

(c) can you turn on TRACE and determine at what point(s) it is actually
blowing up?

A copy of the source might also help, if it's not too large.

OK, I'll bite. HOW is it done? Keep in mind that, due to the nature of
MIDIcom, I need to use GEM programs (TOS apps disconnect the network); I
haven't found a way to init a GEM app without it grabbing the screen.

>You don't have to get the "usual messages". It's entirely just what
>messages the programmer puts into the program. Just the same way as a TSR
>could have various messages.

I can compile a program that doesn't print ANYTING to the screen - it still
creates the app name above the menu bar, and a blank display.

>Using a TSR will not solve the problem.
>
>Using a program that does not output to the screen, be it TSR or not, will
>solve the problem.

Two seperate problems - non-display is needed, and a TSR is prefereable
becasue, even on a fast hard drive, there is significant delay loading an
app on an 8 MHz system.

>I presume you have a hard disc drive, in which case software generally
>loads quite quickly anyway.

"Fast" != "fast enough" in this case.

>Alternatively, you could just set all your file viewing software to load at
>startup so that the desktop passes files to them by the AV protocol. This
>way you don't have to wait for the software to load, since it is loaded all
>the time.

Precisely what I had in mind.

What version of NVDI do I need or is there a program I can run in
the auto folder to give me control back. None of the cpxs etc. do
anything. The ICD booter 6.4.3 gives me the right colors when I get
to the desktop. I am guessing because it sets the screen rez for
the boot. HDDriver 60 does not.

no neither did any of the game testers who had it for around a month
or more before release, I am pretty sure they would have mentioned the
little chap either hanging in mid air or "a programming bug" that made
him fall off ledges he was stood on,
Maybe I should sack the playtesters (only kidding gang<grin>)

>>Hans, if Heartland is that bad, if its as sad as you are trying to
>>make out, then its time for me to pack up,

>Nope. Judging by the comments of gamers in c.s.a.st when Heartland was
>released, I would say that Hans is in the minority on this one...

I got an excellent response from Heartland, maybe because we insisted
in the documentation that the only way we would continue making FREE
software was to get encouragement, I got loads of emails, but now that
the game has filtered through to the PD libraries catalogues we are
starting to receive snail mail with very good comments, honest we are!
Yet no one has mentioned dodgy sprite detection?

>>>basic for making games in 1996. So either Gfa, Hisoft or Omikron basic is the

>>
>> hahahahahahaha yes I agree anything is better than STOS for making
>>GEM games.....but who the F wants a GEM game ????

At this point I was getting rather wound up, but still managed to
keep it to one capitol letter :)

>> I can show you a good game written in 1996 in STOS BASIC, you show me
>>one in GFA, HISOFT or OMIKRON and you win, in other words back up your
>>statement, I DID ?
>
>hehhee... lets tear appart a GEM game. I bet most of them run in more than
>2 vbls per screen update... :)

I think the problem some people have <ahem!> is that they are viewing
the game, and other STOS written software, from a programmers point of
view, this is all well and good in a programming forum, but when
commenting on the viability of a game, ie: its usefulness as a game,
then it should be viewed from a players point of view,
The person sat at home with his telly and ST playing a game, if he is
enjoying it then he wont complain how many vbls it took to update the
screen or what language its in, or where the files are stored, he wont
mind not being able to multi task or render some artwork or whatever
while he is playing, a full good game should keep him happy,
I say STOS is the best BASIC to achieve this task...

And I am still waiting for someone to prove me wrong ? with something
a little more tangible than talk...ho and ascii drawings :)

Cheers.............!ynoT

>routine.
>Is this normal, or what?

The reason for this is, that the compiled code does use some CPU
registers, which are *NOT* saved and restored before and after your
assembly code. So all you have to do is to save and restore the
registers that your routine uses. You can do this inside your code or
use a compiler option.
Sorry: I have forgotten which registers are critical and how the
compiler option is called.

```
D > The error is two bombs : bus error, poke or peek possibly
D > wrong. The same thing does not happen on an Atari STe.

Unless you have modified your Ste to use a 68030, I probably can't
help you. I used to get 2 bomb errors when I tried to run programs
on a ST which I had developed on my TT. The problem there had to do
with setting int or long pointers to odd valued addresses.

Specifically, I was creating a file header which included a string.
When the string was an odd number of bytes long, the rest of the
header was mis-aligned in RAM.

> I am having a problem with a program I have written, on an Atari STfm
> (1/2 meg) it crashes at a seemingly random point for no reason I can
> find. The error is two bombs : bus error, poke or peek possibly

To be exact:
Bus error: you tried to acces (read or write) memory on which you haven't acces rights. In supervisor mode this can only be non existing memory. In user mode it also can be acces to the hardware registers or memory below the adres $800.

> wrong. The same thing does not happen on an Atari STe. Is there a
> reason for this error that I can program around? Any help or ideas
> would be much appreciated. Cheers

As the program works on a Atari STe. You try either to read or write STe specific hardware registers, or, because your STfm has only half a meg memory, you tried to read or write above the 512 kB border.

Maybe you should put print statements around every construction that's allocating memory:

```
print "Start of memory allocation"
'Allocate your memory here
print "Memory allocation was succesfull!"
```

Same thing around statements where you are accessing memory blocks you haven't used before.

Hope this helps, Hans Wessels

> into one file, theres no reason why not to have them anywhere I want
> ?

Yes, if you are keeping data on a single disk changes of loosing data are low. But there are also people how are keeping their data on harddisk, packed or depacked. If someone on the computer club is asking me about a certain program, I might say "It there and there on my harddisk, copy it yourself.." and data gets lost very quickly. Less folders and data files means simply lower change of any data getting lost in the process of archiving, copying, rearchiving, datatransfers etc.

Copying from harddisk to disk is faster when there are a few big files. Same is true for loading data from disk while starting the game (although the speed advantage is very small).

A few big files generate less slackspace then a lot off small files. Especially on big harddisks like mine (big cluster size is the problem).

And yes, on big file is better compressable as serveral small files.

> Wouldn't it be nice if the demo you sent me did not have loads of
> different programs on it, then your explanation would not have looked
> so silly, had you practised what you preach ????

All the data the inividual demoscreens need are in the program file. Except for the digisound table and data, because those files are used by multiple programs. Every executable is a working program on it's own, except for the loader which binds all programms together in one demo. So I think I have indeed practised what I preach. I even delivered a textfile with the scrolltext stories, so you haven't to hack into the programs just to read them in your own tempo.

Cu, Hans

> there old machines they obviously wanted to get away from, it would
> seem they have no choice?

Indeed. The number of games making use of the special abilities of a certain power machine is very low and probably zero, because there is more variety in the hardware. Normal ST(e)'s are a nice standard, but even on a falcon you can't be sure about the bus and processor speed.

> waddaya mean "Again wrong" :)
> Yes I am speaking about the English speaking community because thats
> the only community I know, perhaps I should keep mentioning English
> speaking in every sentance?...you seem to be overly pre-occupied with

Yes I would like to point out that this bank 7 bit was purely as
simple as possible an example I could give of what a bank is to a none
STOS user,

```
Yep RESERVE AS WORK 7,64000
BNK=START(7)
REPEAT
PHYSIC=BNK :WAIT VBL
BNK=BNK+1280
UNTIL FALSE
```

And hey presto, cheap hardware scrolling at 8 pixels on a FM, can be
done at 4 pixels but uses twice the memory :)
The above was to ei: something, dont actually do it like that for
gawds sake :)

>question or have some serious suggestions!!

You don't need ST_guide; any plain-text editor will do (I create HTML documents both personally and professionally, and I use either Wordpad or Everest, depending on which system I happen to be sitting in front of).

You can use CAB (or Webspace) to view your results; if you happen to be running STeno as a desk accessory it's easy to flip back and forth between the editor and viewer.

First, examine the source of a page which displays the features you are interested in. First principle of programming: Steal from the best. Make no mistake, HTML code /is/ programming.

Second, create a "blank page" template containing the minimum required headers (e.g.,) and any "vanity" headers you want
included in all of your pages.

Now load the template, and start copying the parts of the other page that interest you. Don't be afraid to experiment! You can't damage your computer with HTML, and there's no such thing as a "finished" Web page, so keep trying things until you like the results. Each time you save the page, load up or switch over to your Browser and look at what you have so far.

Most important: Have fun!

Using MagXDesk select the GFa application, and goto options->Install Application and limit the memory available to it say 2500k on a 4mb machine. This will cure the problem with selection boxes caused by GFA hogging all the memory, if not try setting to run as a single task.

> assumption that one of your criteria for a good game is one which is
> fast, updates the screen smoothly etc.
> This is not what you get with a GEM based game.

The first thing I tried to find out when I read Tony's original posting, was what he exactly ment with 'game programming' and 'best'. (A least, that was my intention.) He made it clear that game programming is simply game programming, so every game has to be accounted.

So I have got two ways to prove his statement is false:
1: Prove there are games that can't be written in STOS.
Well, even Tony says GEM games can't be done in STOS so let's forget this point.

2: Prove there are better games done in an other basic than STOS, or C. This is a bit harder to do because haven't been very active in the ST gaming and demo scene since I completed my Omikron Basic demo (about 3 or 4 years ago).

Maybe I will convert the main menu of my demo into a Pacman game, then the second point will be solved too (Mowzis creeble, just suffered an ego overflow). But first I will try to locate a Gfa basic game that meets my arcade criteria. I don't bother to look for C arcade games because a c-programmer that writes an arcade game in C probabely can't stand the temptation of optimizing some parts in assembly and by that ruling the game out of the competition.

Now the point of best. That's an other hard point. Let's assume the best language is the language that produces the best games, no matter how hard it is to make such a best game in the language of choice. To see if a game is good we have to look at the game type. A simulation game like 'Civilisation' has to meet other criteria as a puzzle game like 'Sokoban' or an arcade game like 'Heartland'. And indeed, a good arcade game has among other things 1 vbl screen updates, direct reactions to the joystick, precise and symetric sprite control according to my standards. (There is also the need for good graphics, game concept, game play. But these are more design issues, not very language dependent.)

> If your definition of 'best' means that this is of no consequence, why
> mention the VBL figures. Also, if following this line of reasoning, a
> demo would be of no use as proof either way, as all this is showing is
> the speed of execution.

When we are evaluating arcade games, the main menu of my demo comes close to an arcade game. There is nothing to play against, but all other factors are there.

Hans Wessels

BTW:
> most computer terminology is multi-lingual as it was invented WAY after
> the languages had formed...)

But language purists see the danger of people understanding each other so they make German people talk about Festplatten, Dateien, Speicher und Tastaturen and french porgrammers have to talk about octets (forgot the other french computer terms I came across).

No, I think you have messed you bombs up. Word or longword reads from a uneven adres causes an adress error. And an adress error causes three (3) bombs.

> And hey presto, cheap hardware scrolling at 8 pixels on a FM, can be
> done at 4 pixels but uses twice the memory :)
```

Ok, source code now we're getting somewhere. Two questions:
1: How do you align your screens?

Screen memory has to start on a 256 byte boundary on a plain ST. I don't see any aligning. In omikron I would do something like:

```
Scr=memory(64256) ' Get some memory
scr+=256 ' anticipate round down
scr=scr and $ffff00 ' get 256 byte boundary
repeat
scrp=(scr and $ff0000) + ((scr and $ff00) shr 8) ' calculate videobase
lpoke $ff8200,scrp ' poke directly into hardware register
wvbl ' wait for vbl
scr+=1280 ' change offset
until(0)
```

2: What if banks get delete around bank 7? The memory manager of STOS will move the bank in memory and so your screen data will be moved, resulting in the wrong memory will be displayed. So will something like this work?

```
reserve as work 6,10000
reserve as work 7,32000
reserve as work 8,9000
memp=start(6)
for i=0 to 9999
poke memp+i,0 ' clear bank 6
next i
memp = start(7)
for i=0 to 31999
poke memp+i,255 ' set bank 7
next i
```

```
memp = start(8)
for i =0 to 8999
poke memp+i,0 ' clear bank 8
next i
physic=start(7) ' display bank 7 (should be black)
wait vbl
free(6) ' release bank 6
free(8) ' release bank 8
garbage collect ' force garbage collection (I am not sure of the
' command)
wait vbl ' screen should be still black
memp = start(7)
for i = 0 to 31999
poke memp+i,0 ' clear bank 7
next i
wait vbl ' screen should be white
```

Just curious.

>a good game are thought of as not worth while with the shrinking user base which is
>why we dont see all that many games written in pure asm. these days...

Yes and I would suggest that the incentive is not there, commercial
games must be dead, shareware has never IMHO been a way to go for
games, some acceptions of course, but not really?,
Personally my incebtive was always to try and make something in the
hope that it would be good enough to appear on a cover disk, that way
you at least knew that people would see your work, if not on a cover
disk then a review in a magazine, however all that has gone it would
seem :(

My ONLY incentive for making games, or whatever? is feedback, nothing
else, there is no other incentive to make FREE software, enough
feedback is good enough for me to keep going, but anyone else?..
BTW "me" includes my artist partner who thinks the same:)

>Having said that, there was enough negative feedback to convince Tony not to start
>doing edu. stuff and to do heartland/dimond-ice instead, so it cannot be /that/
>dead.

True, I really did think there was a gap to be filled, some decent
educational titles, but only two responded, a better response was
gained when a graphical adventure was mentioned, it would seem most
like that idea,
But although everyone liked Heartland, they all asked where the
puzzle was?, I explained the idea was a fast and SIMPLE platformer but
having taken note of how many wanted a puzzle, thats what DIAMOND ICE
is, simmilar to hearland, but with more animation, no doors! but with
charactors to meet and talk to, objects to find and use etc, a reet
good puzzle :)

>> <Cue several replies from the STOS mailing list!>

cue sublime advertising by Tony :)

You *can* use STOS memory banks for holding the physical screen... you
just tell the hardware to point to it! STOS memory banks are a must for
holding extended screen modes (32000 bytes). They *do* work like this, I
have used this method on the Falcon in 320*264 resolution and there are no
problems whatsoever! And I don't tell stos "use bank 7 for physic", I
just set the hardware to point to the start of the bank or half way
through (I reserve twice the needed size to have a buffer).

Source record: 8527
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,comp.emulators.misc

Hi,

I am really desperatly searching an emulator for PCs which emulates
my 1040STFM with TOS 1.4 (I thin) or 1.2.

Up to now I tried several:

MagicPC (full version) : problems with fileselectboxes (*)
MagicPC (demo) : No use, due to disc only file access
Gemulator96 (demo, with MagicPC Magic_OS 1.0 96/6/26):
same problems as MagicPC full version
STonX : Is known not to run GfA3.x
Tos2Win : Did not run (Page fault under W95)
ST??? (som efrench emulator, from the comp.emulators.fawq):
The address was inactive (No files there , no
mail reply but a timeout sending mail!)

(*) the problems seems to depend on MagiC. As long as I use Magixdesk
I can access all data from the desktop. But when I switch to GfA Basic
and try to load a file, th eselectboxes stay empty. Nevertheless I may
load a program when I type th ename blindly. But then GfA behaves bad
when trying to load a file. (sometimes it works, but mostly it
doesent). Using Gemini1.999(!) as a replacement makes it even worse,
as gemini is not able to open any drives ("Error: fgetinfo failed").
Using the supllied shell tells me: "Not enough memory to open
"<unreadable sign> but this cannot be th ecase (16M, 1,2G HD)

So please, has anyone an idea how to continue??

Please suggest help to
Ronald

ps1: I use W95 and Linux, so both platform solutions will be welcome.

I am realy sorry, but I just see it like that. When I am standing on a platform and there is some platform free on the left side of the character, so my red liquid powered processor concludes he can savely direct the figure a bit to the left and, surprice surprice, the character falls down! I don't expect Rick Dangerous quality of character control, but I think game play would be better if it would be fixed.

> sheeesh .it does not happen the way you are making it out, I dont
> mind critism at all,in fact I welcome the feedback, it helps to make

Ok, there is something wrong with the sprite data. When walking to the right against a blue background a white pixel infront op the character is periodically visible. When you walk against a wall and keep moving you can se some data in the face is distorted and also some junk data in the wall is (periodically) visible. (The data is already distorted in the sprite buffers you use.) Just to be sure, it doesn't make game play bad, nor does it say anything about the used programming language, it's just a minor flaw.

The Falcon's blitter in Hog mode is quite fast. However, you cannot have any interrupts running that occuply alot of CPU time or it seems that uses the DSP, like a MOD player. I have an engine that I used on the Falcon for Towers II. If you wish, I could put it somewere you can look at it.

I also have some code for blitting in TC mode with the Blitter, but I don't recall where it is.

There's not a lot I can say without more info! What language? What are
you programming? Does it access hardware? Was it written on the STE
originally? Is the cpu in userstate - if not can peek/poke cope (some
can't)?

You can't program around a bus error as such. You need to find it.
Once found, the reason and thus the solution will usually be obvious.

If you have no access to a debugger (and they aren't much use imo)
then there's nowt like a few good old print statements to find out. I
always use the binary chop method when I'm completely flummuxed (or
too darn lazy)!

It may seem random, but it isn't....

>find. The error is two bombs : bus error, poke or peek possibly wrong.
>The same thing does not happen on an Atari STe. Is there a reason for
>this error that I can program around? Any help or ideas would be much
>appreciated. Cheers

We are going to need more detail than that, I expect...

I guess from the words 'poke' and 'peek' that its Basic. GFA, IIRC?

What does the program do? does it use any interupt based routines? (eg. sample players, joystick / mouse reading, mod players etc.) as these are likely to cause bus errors if you do nasty things to them.

I assume you are not changing any hardware reg's. with peek/poke?

Try removing sections of your program (comment them out) and see if you can stop it from happening. Then re-introduce bits one at a time, until it starts to happen again. You will then have tracked down *part* of the problem...

Hope this is of some help...

Anthony

>speaking and only want to write games for the ST and STe.

It all comes down to the definition of 'best'. From your previous remarks about
Tony's games (eg. no. of VBL's per game-loop) I made the assumption that one of
your criteria for a good game is one which is fast, updates the screen smoothly etc.
This is not what you get with a GEM based game.

If your definition of 'best' means that this is of no consequence, why mention
the VBL figures. Also, if following this line of reasoning, a demo would be
of no use as proof either way, as all this is showing is the speed of execution.

Anthony

(btw. if you try 'francais' into the STOS editor, it all turns into French,
so it certainly isn't just for English programmers! - and also, most
computer terminology is multi-lingual as it was invented WAY after the
languages had formed...)

Atari ST Monitor, Books & C Compiler for Sale

HIRES Monochrome monitor, works good $55.00

Atari ST internals by Abacus Software $13.00

Atari ST 3D Graphics Programming
Concepts and Techniques By Abacus Software $13.00

Programmers Guide To GEM by SYBEX $13.00

LaserC: Original version and upgrades up to 2.1
Complete with utilities Includes Original Book $35.00

Dead Original Atari 1040 ST, open, good for parts Shipping charges

All of the above for $100.00
All books for $ 30.00
All books & Compiler $ 60.00

Terms: COD, buyer is responsible for shipping charges.

Please keep in mind I have not been in touch with the ST community in
about 6 years. I don't even know if people still use GEM as the main O/S
for the ST. I used to use a UNIX like environment.

>To move the thread on slightly are we seeing the demise of game programming on the ST??

To be honest, yes. I think that the games scene is shrinking, and this is why we are seeing less games - in any language. The vast ammounts of time needed to write a good game are thought of as not worth while with the shrinking user base which is why we dont see all that many games written in pure asm. these days...

Having said that, there was enough negative feedback to convince Tony not to start doing edu. stuff and to do heartland/dimond-ice instead, so it cannot be /that/ dead.

> <Cue several replies from the STOS mailing list!>

hehehe... I was almost tempted NOT to reply. :)

3706. Bulletproof TRAP handler? (long)

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-22 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <b177cc$21b1.2bf@HERMES>
Source record: 8538

Does anyone have some 68k assembly source for a bulletproof trap handler that can be called from either user or supervisor mode?

I want to extend my Toolbox TSR (which is called via one of the Atari's 12 unused TRAP vectors) to allow it to be called from Supervisor mode as well as User mode, but the code I have written seems to be far from ideal. (Or am I being a bit too picky?)

Originally, it was callable from User mode, and expected function code and arguments on the 68k User stack, and the called function would receive the arguments as if they had just been JSR'd directly by the calling app.

That limitation (only callable from User mode) was due to my need to rewrite something like 2000+ lines (in 68k assembly) of Toolbox code in 24 hours after a power supply meltdown a while ago (in my TT) cost me my hard-drive and the data on it (read: it occurred two hours prior to a scheduled backup). It was easier to implement it that way than to generify it to allow calling from anywhere.

A few people have expressed interest in using the TSR with their own progs, so I would like to generify the handler so it can be called from anywhere.

At present, my (very inelegant) implementation, after detecting it has been called from supervisor mode, copies six longwords from the supervisor stack onto the user stack and then points the SSP at the data prior to JSRing to the called function. (This way the saved registers and trap frame [on the supervisor stack] are preserved).

However, this implementation feels very inelegant, and will definitely cause problems with called functions needing more than six longwords of parameters. AFAICR, none of my code requires more than 20 bytes (5 longwords) of params, but I could be wrong on that point, though.

A further complication is that the TSR is extensible, and so extension modules loaded at boot time (for such things as bitmap expansion of an image, disc editing tools, and suchlike) may be called. This is all handled (faultlessly) in the code which disambiguates the function number.

I can't guarantee the re-entrancy of the code, though. (BTW: Are there any OS's for the Atari which allow pre-emption when in supervisor mode?)

Here is (roughly) what my code looks like in Devpac 3.1:

(BTW: I am doing this from memory - I don't have the source code handy, as I am running my TT in monotasking mode as Connect 2.46 is somewhat more reliable when monotasked than my usual Mint 1.14/AES 4.1 multitos setup)

```
; "is it a toolbox call" has run, and it has determined that
; it is a genuine Toolbox call. It then branches to this

movem.l reglist,-(sp) ; save regs
move.l usp,a5 ; save user stack
move.l usp,a6 ; get user stack
moveq #6,d7 ; trap frame size
cmp.l #68010,_cpu ; are we using an '010 or better?
blo.s .68k ; nope - just a plain 68k
addq.w #2,d7 ; increment frame size for '010+ cpus
.68k btst #13-8,trap_sr(sp) ; check if we are called from supervisor
beq.s .user ; nope - user call
move.l trap_sr+24(sp,d7.w),-(a6) ; copy param #6 to user stack
move.l trap_sr+20(sp,d7.w),-(a6) ; copy param #5
...
move.l trap_sr+4(sp,d7.w),-(a6) ; copy param #1
move.l trap_sr+0(sp,d7.w),-(a6) ; copy function number
move.l a6,usp ; point user stack at params
.user

; disambiguate function number (at address pointed to by USP)

; a4 will now contain address of function that will be called

move.l (a6)+,a3 ; lose function number from stack frame
exg a6,sp ; save SSP in a6, point SSP at params
jsr (a4) ; call function
exg a6,sp ; restore SSP
move.l a3,-(a6) ; restore function num in stack frame
move.l a5,usp ; restore USP
movem.l (sp)+,reglist ; restore saved regs
rte ; return to caller
```

A typical call to the Toolbox is as follows:

```
tlbxProcessor:
pea buffer ; buffer to be filled in with CPU, FPU
move.l #$430,-(a7) ; function number
moveq #0,d0 ; interface
moveq #$10,d1 ; interface (MAGIC number)
move.l d0,a0 ; interface
move.l d0,a1 ; interface
trap #0 ; call toolbox
addq.w #8,a7 ; fix stack
```

(The Toolbox call interface requires d0,a0,and a1 to be zero, and d1 to be $10. I sort-of had ideas for the zeroed registers when I designed the Toolbox interface, and am still mulling over which variant will succeed and become the newer interface)

In this case, "buffer" will be filled in with the CPU and FPU installed in the computer.

Having this function in the TSR allows me to have one call in my app which can interrogate the computers processors, regardless of TOS version, and free of the "incorrectly programmed FPU cookie" bug in all versions of TOS 3.x and 4.x that I am familiar with (in essence TOS programs it to say "there's one there, but I can't work out which FPU it is"). As a side effect, depending on the software you use, the system speeds up by about 5-to-10 percent when the FPU cookie is correctly programmed.

I think we all have to make acceptions for the way each of us
explains or tries to get a point accross, I doubt its very easy to say
something and it be totally understood by everyone in the world, It
would seem that most people in these newsgroups and indeed on the
internet or either students or ex students and therfore (supposedly)
educated, so they tend to pull up those with shall we say less of an
education,

> cabable of producing more messages than the english speaking 'the rest of
the
> world'.

This in itself may not be so stunning as it first seems. I read some years ago (I cannot remember where) that about half of all the computers sold by Atari worldwide went to Germany (and, furthermore, those sold there were on the average heavier models - megas, TTs etc - than elsewhere). THAT, admittedly, IS stunning (if true) and so is the circumstance that the American "home land" of Atari doesn't seem to have more Atari computers/users than Britain or France with less than a fourth of the US population. All this may possibly be explained by Europeans in general and Germans in particular being more clever and progressive than the conservative Americans. But, seriously speaking, I think it may also have something to do with Atari selectively targeting the European and in particular German market (at the expense of the American one), apparently because they felt they could get more money here.

So half of the Atari community may actually BE German, which would well explain why an Atari news group in German (BTW, I missed the message with the name of this group) could be more prosperous than the "rest of the world" one in English; some of the rest-of-the-world citizens (did I say the French?) don't much like to speak English I've heard :-).

Hi,

as I am trying desperatly to run an emulator together with GfA3.07 I need a TOS image 1.4 or 2.0.

I DO have an image 1.02(!) but it doesn't work with gemulator and probably won't work with all the other emulators.

MagiC 4.00 absolutly doesn't comply with GfA3.07. Somehow the file handling is broken, so I cannot access files properly via fileselectbox or direct input (even though it READS the files, it fails to list them or to detect the EOF properly :(((((

So please, is there any TOS image around? It would not be copyright violation as I DO own an ST.

PLease help
Ronald

ps: I would need an ftp access to it . I am not used to BBSs systems. I can offer a ftp space here, where YOU could download it too as well.

> don't you think ?

Yes, I think exaggeration mode was on. Still I like to do something like this:
(ASCII 'Art?' mode on)

```
############ <---- platform to be jumped to

__
('')
/( )\ <---- play character
AA
########## <---- platform it is standing on
```

(SCII Art mode off)

Sitation: the play character is standing on the extreme right position of the lower platform (with its right foot more or less not completely supported by the platform) and it wants to jum up to the platform above it. The two platforms are not overlapping but where the first ends the second starts. So we just jump (not moving the character to the left or right) and glory glory, the stands on the upper platform (with its left foot more or less not completely supported by the platform).

Need a very niggling (on certain points) beta tester?

> Exactly, GEM games are certainly not excluded, but you seem to be
> trying to make the point that in order for a game to be the best, it
> has to be GEM, and that I am afraid is laughable, I am not excluding

Still there is the catagory GEM games and programming languages which can be used for writing those games. Arcade games are the hardest to do in GEM and you will never get the performance in GEM like you can get by going directly to the hardware. But there are more catagories of games.

> GEM, but I have not seen a good GEM game made this year written in

Who will program it for them? Do you know how to acces the PCI graphics card in a Hades? Would you write a game special for those few Hades users? The only games that will work are GEM games!

> Your turn :)
e2-e4 (Just compile GNU chess, it's C and will blow any STOS chess away, I think but then again, never seen a STOS chess.)

Please, leave the user stack intact, because you can't be sure it's in use as a stack by the user program. The user program may use the stack-pointer just like any other adres register. (I frequently do so.)

Why not:

```
movem.l reglist,-(sp) ; save regs
move.l usp,a5 ; save user stack
moveq #-6,d7 ; trap frame size
cmp.l #68010,_cpu ; are we using an '010 or better?
blo.s .68k ; nope - just a plain 68k
subq.l #2,d7 ; increment frame size for '010+ cpus
.68k:
btst #13-8,trap_sr(sp) ; check if we are called from supervisor
beq.s .user ; nope - user call
lea trap_sr(sp,d7.w),a6 ; position of data on the stack
move.l a6,usp ; user stack points at params
.user:
....
```

Maybe fist figure out if it was a user call or not and after that bothering about the processor type:

```
movem.l reglist,-(sp) ; save registers
btst #13-8,trap_sr(sp) ; user call?
move.l usp,a5 ; save usp, so you can always restore it
beq.s .user
lea -6+trap_sr(sp),a6 ; position of data on stack
cmp.l #68010,_cpu ; test processor
blo.s .68k
subq.l #2,a6 ; correct position
.68k:
move.l a6,usp ; usp is now correct
.user:
```

You can't use the user stack as stack anymore, because pushing things on the stack will distroy your stackframe making a rte a call to nirvana.

Bye, Hans

Fenix does to some extent. In Supervisormode ipl-level 2 is preemptive
while higher ipl-levels are not. This to avoid preemption of interupt-
handlers and maintain compatibility with MiNT applications.

I would not recommend using the spare traps for anything since Fenix is using
them to speed up dispatch of kernel funtions. Using spare traps will
effectivly make your programs incompatible with Fenix.

Fenix has three different library schemes ranging from shared libraries to
application-to-application communication and object embedding. Applications
that wants to make some of their capabilities accesible from other applications
can use these schemes.

s> This little thread came out of the BASIC thread...so should I know
s> what a "toggle switch" is ? because I dont?

You youngsters don't need to know :)

On the earliest computers programs were entered on the engineers' console by first setting the bit pattern of the address on a bank of toggle switches then by setting the data to be entered at this address.

You really learned the value of "dry-run" de-bugging in those days! Anything to reduce the number of times you had to go through this ball-breaking procedure.

Since the problem seems to be related to magic, why don't you try using
a TOS img with Gemulator (You can put a TOS image in place of magic, it'll
work)
STonX works fine with GFA2.0, I've never tried it with 3.x, but I don't
know why it wouldn't work.

m > adress error causes three (3) bombs.

So it does. Sigh, it WAS a long time ago.

A likely culprit would be messing up the stack then doing an RTS.
Maybe the STe and STfm use different supervisor stack sizes.

>used for writing those games. Arcade games are the hardest to do in GEM and you
>will never get the performance in GEM like you can get by going directly to the
>hardware. But there are more catagories of games.

of course, so we are agreed, gem is not excluded and indeed never has
been, only you seem intent on saying it is/isn't, gem is included, but
that does not alter the plain fact that the best BASIC for making
games in 1996 is STOS...you said yourself there are other catagories,
so you cannot exclude STOS just because it doesn't use bland boring
GEM?

>No, I haven't seen any new game this year unitl we started the thread. But your

wow, they say you cant beat the old way?....I think mine was simpler,
don't you?

>2: What if banks get delete around bank 7? The memory manager of STOS will move
>the bank in memory and so your screen data will be moved, resulting in the wrong
>memory will be displayed. So will something like this work?

your wrong, I really do wish you would stop thinking you know how
STOS works, you have no idea, I would not dream of trying to

understand your ormikron

7 will always be the start of bank 7, no matetr how much deleting,
reserving loading or erasing you do, say bnk 7 or start(7) or whatever
and stos will go straight to it.

>
> reserve as work 6,10000

snip..wow all those pokes, and you have the cheek to suggest I may use
so many, there is not one single poke or peek in heartland,
I have never in my life had to garbage collect, if that was an
example of your BASIC then I would strongly suggest you upgrade as
quick as possible to STOS BASIC, the days of spectrum and poking
everything are long gone you know :)

> wait vbl ' screen should be white

we have a command called floodpal...ho you really dont know what your
missing

its no use banging a long line of peeks and pokes and expect someone
who is long past that sort of programming to folow it, tell me what it
was supposed to do and I will write the same code in a lot less
commands and simpler for anyone to follow,

WHERES THE GAME THATS BETTER THAN STOS ???

Man, you're hard to please... :-)

I find your assessment of MiNT (incompatible? How so?) somewhat
harsh, but hey, it's your mileage. Not to sound argumentative,
but, for what I do, MiNT only very rarely gives me problems of
any sort, and I use it almost all the time.

OK then, maybe what you are looking for is an .ACC, or maybe a
combination of an ACC and a TSR. The TSR could intercept
double-clicks on certain file types, and the ACC could (I
presume) play the sound without taking over the video. Not being
a programmer, that's about as far as I dare go.

Yves

STOS reserves memory banks on the 256-byte boundary and rouns up the
length of the reserved memory up to the next 256 bytes.

> 2: What if banks get delete around bank 7? The memory manager of STOS will move
> the bank in memory and so your screen data will be moved, resulting in the wrong

Yes it does, I just checked it! Why it works is beyond me... STOS must
have a look at what is using that bank?

The only problem is that the commandline is changed to upper case when you
retrieve it via COMMAND$. Of course in many cases this will not matter.

I am trying to discuss gameplay right now. Is the only thing on your mind this basic game better than STOS?

> I will pass your comments on to the current testers, some of whome
> are watching this thread and wondering what you are on about :)

Is there some garbage in the sprites like I discribed, or do have I a bad copy of your game? I double checked the archive. All crc's are correct and still I have this garbage in the sprite when I am walking to the right.

I know one, it's Wout Klaren, you know, the guy from the Tera Desktop. I asked him just that question. He doesn't care, as long as the game works. Shall I try heartland on his machine?

> e2-e4 is not a valid move, the move is e4 on its own as it is quite

Yes, it is. But the possibility of short notation doesn't make the same move written in long notation a invalid move, does it?

> Neither have I....And it took you 2 weeks to find a GEM game, and its
> Chess :)))) goood one Hans haha

Correction, GNU chess is a commandline game. There are GEM version, but compile the sources from the internet and you will get a commandline game. But you are right, it's another axample of a game I can compile today using C and that can't be done in STOS. Or are we going to rule out these types of games too?

Bye, Hans Wessels

What image needs to be replaced, I have a few TOS images but am unsure
what to replace. There are two files with the tos extension in the
Gemsys folder. If I could use the TOS image I'd be able to use the
emulator in English!!!!

> > You reserve a bank, STOS does the rest :)

>Does STOS know you are going to use the memory as screen memory? No, don't

YES IT DOES, for crying out load!

The difference between permanant and temp is that if you save your
basic listing, the banks will save with it if permanant,

Reserve as screen = temporary screen
reserve as dscreen = permanant screen
reserve as work = temporary work area
reserve as data = permanant work are

Then I can also reserve as music, charactor set, 3d, sprite
and stos will know exactly what to do with them, it will allways know
there start address and size and whatever

>think so. Does STOS automaticly alaign memory banks to 256 bytes offsets so

yes....so there!

>that does know how his programming language works.

hahahaha like you know what your talking about, your trouble is that
you are only capable of talk,
I thought we where having an adult debate, looks like i am wrong,
every thread you have been in so far you have tried by whatever means
that you can to weasel out of putting your skills where your mouth is,

Ok i will leave this thread with pleasure, you can stay in it and
talk to yourself until you actually win a debate, probably take you
ages hehehe

I might see you again in the STOS debate if you ever get up enough
guts to stop talking and start proving what you say?

Cheers.............!ynoT

Is there any way to make my STe think it is an FM

I regularly use FIGGY that will make my 4meg into a half or 1 meg but
wondered if it was possible to make it think its a FM

For software testing you see:)

Cheers.............!ynoT

First of all,

Tony: I've downloaded your games (Multi Pakman, HERO, Heartland),
and (after some trouble) I was very impressed. The look is a little
homemade, but the gameplay is very good.

What are my troubles?

- Multi Pakman & HERO doesn't run from HD.
- All three games are not full synchronised to the VBL,
because they are unplayable with my T-28 speedup board.
The sprites are jumping around very nervous, game control (especially
Multi Pakman) is impossible, because it's too fast.
If I toggle back to 8 MHz, all is OK.
- If I start the games not from ST low (I use usual ST high or better) the
screen is trashed and the system hangs.

The reason is simple: The sprite is wider than the raster of the playground!

```
__
('')
/( )\ <---- play character
AA
########## <---- platform it is standing on
I I I <---- raster width
```

>the subject and will try not to talk about things I have no knowledge
>of :), seriously :)

Hhmm, I suppose there is some confusion about the OS structure of ATARIs OS?

user
GEM application hardware independed

VDI AES
GEMDOS
BIOS XBIOS
hardware dependend
hardware

example:
BIOS: Basic Input Output System Rwabs - Read/Write Sectors
XBIOS: eXtended BIOS Rsconf - configure serial port
GEMDOS: GEM Disk Operating System Dfree - Get drive free space

GEM: Graphical Environment Manager:
VDI - low level GEM,
AES - high level GEM
VDI: Virtual Device Interface vro_cpyfm - copy raster, opaque
AES: Application Environment Services wind_create - Create GEM window

I suppose that STOS uses only BIOS, XBIOS and GEMDOS.

The functions from the higher layers (GEMDOS, VDI, AES) are much more
powerfull than the lower layers (BIOS, XBIOS).

For example:

I want to know what video hardware is present.

I can use Getrez (XBIOS 4), which return 0, which means "something like ST low"

Or I use v_opnvwk (VDI 100) which fills a array of 56 integers.

If you evaluate this array, you will get informations about the selected
device (plotter, printer, screen, alternative second screen), about the
resolution (width & height of the screen, width & height of each pixel,
number of colors, number of pens, number of patterns, number of fonts
and so on.)

Do you see the diverence?

>> >....but who the F wants a GEM game ????

>answer, I will let you work that one out,hehehe
>
> Your turn :)

Your wonderfull STOS games are not running on this nice big ataris!
Most of them have extended graphic hardware, the only access to screen
is VDI! STOS does not make use of VDI, it writes its drawings direct into
memory. This is fast, but will only work on original ATARIs (ST/STe/TT/FALCON
without extensions).
The GEM window redraw on graphic cards is many times faster than in ST low.

I wrote some applications for GEM, and yes, they are also running on a
Apple Perfoma 460 in thousands colors using MagicMac without any modifications.
Just seen yesterday. The only difference is speed. A PowerMac 8500 or a
Hades 060 is more than 20 times faster than a 8 MHz ST.

There is no choice between GEM games and none GEM games, because you can
only run GEM games on the new powerfull atari compatible computers!

Tony: Why do you dislike GEM? Have you ever worked on a "big" atari?
(A simple falcon is not a big atari to me.)

BTW: Is there any (GEM) monopoly game around?
In case there's no one, I'm forced to write my own...

Does STOS know you are going to use the memory as screen memory? No, don't think so. Does STOS automaticly alaign memory banks to 256 bytes offsets so ignorant users can use it for screens? Maybe, who knows.

>> Scr=memory(64256) ' Get some memory

No, only the first line is. The second and third line are to make sure my screens adress will be aligned to a 256 byte boundary.

>> repeat
>> scrp=(scr and $ff0000) + ((scr and $ff00) shr 8) ' calculate

Mine is faster. And speed is al you need to get good arcade games.

No, I don't know how STOS works, that's what I am trying to figure out.

> 7 will always be the start of bank 7, no matetr how much deleting,
> reserving loading or erasing you do, say bnk 7 or start(7) or
> whatever and stos will go straight to it.

STOS will, but does the hardware know? Does STOS start to move around banks in memory or not when you delete surrounding banks? I was told it did. But you insisting there are no problems it seems like it doesn't.

>> reserve as work 6,10000
>
> snip..wow all those pokes, and you have the cheek to suggest I may
> use so many, there is not one single poke or peek in heartland,

As you told me I don't no how to program STOS, so I don't know how your memset command is called. (Probably it depends on which extension you use).

> I have never in my life had to garbage collect, if that was an
> example of your BASIC then I would strongly suggest you upgrade as

> everything are long gone you know :)

Sometimes it's still the fastest way to do things.

>> wait vbl ' screen should be white
>
> we have a command called floodpal...ho you really dont know what your
> missing

We are not messing with palletes, we are messing with screen memory. Changing the pallete is not an option here. Your comments suggest you haven't the slightest idea where I am talking about.

> its no use banging a long line of peeks and pokes and expect someone
> who is long past that sort of programming to folow it, tell me what
> it was supposed to do and I will write the same code in a lot less
> commands and simpler for anyone to follow,

Did you read the comments? I am allocating three memorybanks. 6,7,and 8. Bank number saven is used as screen memory. I fill banks 6 and 8 with zeros. I fill bank 7 with $ff's. But you don't have to understand poke's and peeks, STOS will, as poke and peek is one of the commands available in all basics.

> WHERES THE GAME THATS BETTER THAN STOS ???

I am trying to understand the concept of STOS memorybanks. Just out of curiosity, because someone said STOS memorybanks where such a great thing. Are you willing to help me on this subject please continue in this thread. If all questions I ask are going to be answered by shouting 'Where's the game that's better than STOS???' please leave this thread and I will try to find a coder that does know how his programming language works.

Hans Wessels

Thanks for the comments:)....the games are bound to look homemade,
they are homemade ?
Gameplay is good? a compliment indeed, thanks:)

>What are my troubles?
>
>- Multi Pakman & HERO doesn't run from HD.

I will presume you have not followed this thread? I have been told
its a lame excuse, but I do not own a HD, at the time of writing those
games I had no contact with anyone who owns a HD and the STOS manual
has no mention of hard drives?

>- All three games are not full synchronised to the VBL,
> because they are unplayable with my T-28 speedup board.
> The sprites are jumping around very nervous, game control (especially
> Multi Pakman) is impossible, because it's too fast.
> If I toggle back to 8 MHz, all is OK.

Thats because they are ATARI ST games made on an ATARI ST for ATARI
STs? by that, I mean yer average ATARI ST set up,
And before it is pointed out that I state STOS works on newer tos
versions, the games in question are older pre whatsit :)

>- If I start the games not from ST low (I use usual ST high or better) the
> screen is trashed and the system hangs.

then in the words of Tommy Cooper...Don't do it ? :)

>>>Ok, there is something wrong with the sprite data. When walking to the right

>>
>> eh?...this is all news to me ?
>
>I can confirm this bug.

Well I rebooted the game (something I am not used to doing, playing
my own games<G>) and still cannot see it?, I do not for one moment
dispute its there or question your comments, either of you, juts
simply to say, cannot see it ?

>Hhmm, I suppose there is some confusion about the OS structure of ATARIs OS?

No confusion here ?

> user
> GEM application hardware independed

snip...

>I suppose that STOS uses only BIOS, XBIOS and GEMDOS.

I have absoloutly no idea if the above is true or false,

>The functions from the higher layers (GEMDOS, VDI, AES) are much more
>powerfull than the lower layers (BIOS, XBIOS).

I have absoloutly no idea about any of that, or the bits i snipped,

>I want to know what video hardware is present.
>
>I can use Getrez (XBIOS 4), which return 0, which means "something like ST low"

I have commands to not only find the current resolution, hertz rate
etc, but I can also switch resolutions as much as I want, and none
need any of the commands you mention, neither do I need to know
anything about xbios,gemdos or any of the others,??? I dont really see
your point? none of the words you mention have any relevance in STOS
BASIC, they are not STOS BASIC commands and as far as I am ware are
not mentioned in the STOS BASIC user manual?

>Or I use v_opnvwk (VDI 100) which fills a array of 56 integers.

still losing me?

>If you evaluate this array, you will get informations about the selected
>device (plotter, printer, screen, alternative second screen), about the
>resolution (width & height of the screen, width & height of each pixel,
>number of colors, number of pens, number of patterns, number of fonts
>and so on.)

but I have BASIC commands for all that? simple BASIC commads that
will return any or all of that information, that is the whole idea of
a BASIC language, I do not need to know all the things you are
mentioning, I have BASIC commands that will find it all out and return
the information?

>Do you see the diverence?

NO!

>Your wonderfull STOS games are not running on this nice big ataris!

hang about, whats all this "your wonderfull stos", if you are trying
to be sarcastic then this is all a waste of time :(

>Most of them have extended graphic hardware, the only access to screen
>is VDI! STOS does not make use of VDI, it writes its drawings direct into

>memory. This is fast, but will only work on original ATARIs (ST/STe/TT/FALCON
>without extensions).

without extensions? what on earth does that mean ?

>The GEM window redraw on graphic cards is many times faster than in ST low.

>I wrote some applications for GEM, and yes, they are also running on a
>Apple Perfoma 460 in thousands colors using MagicMac without any modifications.

the thread is best BASIC for games ??????? why do people have to
start prattling on about applications and anything else they can think
of because they are too scared to admit they cannot fault my original
statement,
so far we have had demos, applications, macs, assembler, and attempts
to try and make my software look bad?
Yet no one is showing me anything better

Ok I never said my games where fanatastic, I said STOS is the best
BASIC for making games on the ATARI in 1996,

NO ONE has done anything to prove otherwise, you have all TALKED
TALKED TALKED

None of you can show me a game written in BASIC thats better than
STOS ones, it is childish to start trying to find bad things in my
games, show me something better, thats the whole point, or dont you
all understand ?????

>Just seen yesterday. The only difference is speed. A PowerMac 8500 or a
>Hades 060 is more than 20 times faster than a 8 MHz ST.

and your point is what ??? would it have anything to do with making
games in BASIC, I think not :(

>There is no choice between GEM games and none GEM games, because you can
>only run GEM games on the new powerfull atari compatible computers!

really? I think you will find you are WRONG

>Tony: Why do you dislike GEM? Have you ever worked on a "big" atari?
> (A simple falcon is not a big atari to me.)

I have a STe...thats it, no falcon, no hard drive, i dont even have a
drive B? i have the original atari mouse and a joystick and ONE box of
disks, thats my total atari set up, I manage to make reasonably good
software thats quite well recieved in the ATARI community, beleive me
its not that easy with such a bare minimum set up,
SO no i havent "worked" on a big atari, in my book this is big:)

BTW my software is free, its not work, its a hobby ?

I spent sooo long using programs that are none gem, a few years, (on
the atari) then when i had to use the desktop ie: when i got a modem,
i suddenly had to start using gem...what a let down,

why do all gem programmers think there is only red,green white and
black, surely they can change the colours here and there, I have made
some serious software in medium rez, and they "look" quite nice, I
made angled scroll bars with shape and depth, 3d boxes etc,
Nagggh I definatly dont like GEM its boring IMHO:)

>BTW: Is there any (GEM) monopoly game around?
> In case there's no one, I'm forced to write my own...

in BASIC ? :)

Cheers.............!ynoT

You certainly do NOT need an "HTML authoring program." Even here with a
Pentium/100 I don't use the Netscaep editor - Wordpad is much faster and
it's easier to work with. Write the page, then look at it in your browser.

>I suggest you grab a HTML document to make yourself familiar with that
>language if you are using a normal editor. Just go to Yahoo & search "HTML"
>for where to get the online doc.

That's excellent advice. There are any number of search engines, as well -
and when you see an HTML effect that you want to emulate, view source and
copy it.

If one is writing the parser, one might be thoughtful enough to make it
case-insensitive, I should think. In fact, I usually convert the command$
to upper-case just to be certain.

3738. Silly programming language advocacy issues

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-25 00:00:00 UTC
From: atari@teleport.com.REMOVE.THIS.TO.REPLY
Message-ID: <57cleb$ejs@ornews.intel.com>
Source record: 8344

There is an ongoing thread here that I find personally annoying, wherein a couple of people (you know who you are, I don't intend to increase your infamy) are bickering about which programming language is "best." As someone who has dabbled in just about every language available (and a few no one else seems to have ever heard of), here are my opinions - which are no less valid, and no more valid, than anyone else's:

STOS is terrific for quick development of games running in ST Low resolution.

HighSoft BASIC is terrific for manipulating text and managing the GEM interface.

C (any flavor) is good for medium-sized programs which need more speed than BASIC can provide, but development time is extended.

Assembly is best when speed of operation is the only absolute essential; development time will be greatly extended.

Logo is interesting but not particularly productivity-oriented.

Pascal is a rather bad joke perpetrated by Nicklaus Wirth and UCSD. Great for teaching programming principles on paper, awful for actually programming.

SamllTalk is powerful and very confusing.

Ada is dangerous.

Forth is good for processing lists.

I've tried a few others that you won't have heard of; the upshot is, any programmer should use what HE feels is best for the application he's developing. Remember, the object is the deciding factor. If you want to develop something quickly, you should be using some variety of BASIC. If you want blazing speed, you should be using pure assembler. And if you don't know what you want, it doesn't matter what you use.

Force compilation to a GEM app - then it will not ask for the command line,
but will accept it if called from a program which provides that facility.

> how do i get a fileselector on screen, thats the biggy no one will
>answer ?????????

Ah. I'll have to consult my source codes - which are at home. Email me and
ask there.

A text editor gives you the best control and it isn't too hard to do.
I had my first page done before I even bothered to read any
instructions, simply by pinching bits out of other peoples pages!

3744. TOS images and Gemulator

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-25 00:00:00 UTC
From: Ronald Hartwig <Ronald.Hartwig@Informatik.Uni-Oldenburg.DE>
Message-ID: <57d1u9$40l@news.Informatik.Uni-Oldenburg.DE>
Source record: 8350
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,comp.emulators.misc

Hi,

thanks to all who answered my questions. You all were a lot of help.
So that is how I got it working by now:

Get the TOS image (I now try 2.6) and name it "Magic_pc.os" and let
gemualtor find it. That's all.

The file selectors now work fine. Speed is amazing.

Just two little problems are left:

1) The TOS I got is in english. But I need the Umlautes "ï¿½ï¿½ï¿½ï¿½" and so
on. Does anybody have access to a german TOS version?

2) Funny enough I can read all files from all partitions but GfA will
not detect the EOF. This problem appears ONLY with files imported from
the original ST. When I create the files with the gemulator it works
fine. Maybe I need ti add a (DOS?) EOF character myself. Any ideas?

But thanx anyway for all your help

Ronald

ps: One thing I noticed was that the gemulator won't start up properly
when the printer is absent. Maybe that's a feature and no bug. I still
wonder what this black bar means which continues to get smaller during
boot up of TOS 2.6.

If this is the reception a game programmer gets for producing a FREE game for a dying platform... I would certainly think twice about producing any more for that platform!

Lighten up you guys... at least he is trying to inject some life in the Atari.

Just my 2 cents.

Regards
William

One of the two, or both, input values for evnt_button with the bitmaps for
left and right button should be ORed with the values 0x100.

I can't remember if both values should be ORed, or only one. Anyone else
know, or you'll have to try! :)

Agree, except for the BASIC-part. IMHO (Yeah right!) basic (I'm
talking about the "classic" basic here.) is totally useless. But if
people like it, let them use it...

1) Eeeerm actualy thats not the case and not the thread, they all left
with there tails between there legs, on an eternal search for a gem
game made in BASIC, so they wont be back for quite a while
hehehehehehehheeh <manic laughter>

2) At least 5-6 people contributed to the thread, mostly hot air, but
at least they tried,

3) We are talking about programming, in a programming group? so why
would that be annoying?

3) After all this is "comp.sys.atari.stos" ..isn't it? :))<joke>

>someone who has dabbled in just about every language available (and a few no
>one else seems to have ever heard of), here are my opinions - which are no
>less valid, and no more valid, than anyone else's:

But welcome,

>STOS is terrific for quick development of games running in ST Low
>resolution.

Ho no not another?. you suprise me Rich?

BTW whats this "quick", you think H.E.R.O. was a quicky maybe ?

Diskzine construction Kit (Show me better in any language) used by 5
current live uk diskzines and has been used by many more one offs in
the past, as you can imagine, medium rez, allows you to cut and paste
pictures into your scrolling text....and this is pre-cab etc?

Multimedia display, runs entirely in medium rez and allows you to make
one (packed) document that contains its own, music, sampled sound,
animations, colourd text, various fonts, it not only has its own
individual editors for these options but is also the player,
everything runs in medium rez and will work on a bog standard 1 meg
FM, the total file size for ALL this program is 75k

SHOWTIME uses a medium rez shell to search you directory, and inside
folders to find an array of different format of picture files, the

shows then in a slideshow fashion, but in full overscan by first
stretching the picture then removing all four borders,

TEXTY....eerm hang about..theres a lot more none games serious and
novelty? programs in medium rez and in STOS...should I go on?

Sorry Rich, but your comments go a long way to suggest that you are
not talking about the STOS that is available to the programmer today,
when did you last make a game in STOS, was it upgraded STOS, if not
then you are making comments on a language that is no longer really
used, there are so many new commands, I can't even remember most of
the original STOS ones,

>HighSoft BASIC is terrific for manipulating text and managing the GEM
>interface.

I can imagine and would not dream of saying otherwise,

>C (any flavor) is good for medium-sized programs which need more speed than
>BASIC can provide, but development time is extended.

Again , I would not dispute this, although the last two comments have
nothing to do with the thread, I would still agree :)

>Assembly is best when speed of operation is the only absolute essential;
>development time will be greatly extended.

Yet another that has nothing to do with the thread, maybe thisa would
be a good time to say

I think STOS BASIC is the best BASIC available in 1996 for making
games, and I will go as far as to add C to the whatsit,

>Logo is interesting but not particularly productivity-oriented.

again I agree,

>Pascal is a rather bad joke perpetrated by Nicklaus Wirth and UCSD. Great
>for teaching programming principles on paper, awful for actually
>programming.

HO SHIT!!! I just ordered Personal Pascal :(.....I did!

>SamllTalk is powerful and very confusing.

Never heard of it?

>Ada is dangerous.

She is ??

>Forth is good for processing lists.

Ok..

>I've tried a few others that you won't have heard of; the upshot is, any
>programmer should use what HE feels is best for the application he's

yes yes, that all goes without saying, but really? what does it have
to do with the debate of the best BASIC for making a game in 1996,

Yet another none beleiver enters the thread ,

STOS has been upgraded, I made a statement, I expressed an opinion,
someone should have come along and said, hey not its not, look at
this, this is better, but instead everyone talks about anything but!

Its not enough to tell me how bad STOS is, someone has to show me
better, in BASIC or C, if people come into the thread saying I am
wrong, but show me nothing more than talk and hot air, then I must
reply and defend my original statement, surely the people entering the
thread with nonsense should be chastised for wasting everyones time,

Is anyone willing to dispute my statement wihtout mentiong assembler,
macs, and all manner of things that have nothing to do with the
thread?

ta!

PS......You wasnt expecting anything less than the above was you Rich
<big smile>

Cheers.............!ynoT

Do you mean completely without screen display - even GEM based? I have SuperSAM set up so that it plays .AVR, .WAV and other sample formats. It just plays the sample given then quits. If there is an error (unsupported frequency etc.) it simply gives a GEM alert telling you this.

Surely this is a good thing, rather than doing nothing?

I haven't checked what midifp does... (I dont have any .MID files)

(if you want, I'll write a 10 line C program to play any .AVR sample via SAM with zero screen writing...)

Does anyone know if it is possible to wait for _both_ mouse buttons in one GEM event. And I _don't_ mean both buttons _together_, I mean the left button OR the right button... (binary OR in this case :-)

Darn right - that's why I don't use a DOS box as my persoanl machine

>I find your assessment of MiNT (incompatible? How so?) somewhat
>harsh, but hey, it's your mileage. Not to sound argumentative,

It's not a matter of harsh, it's a matter of practicality. If I could get
MiNT to work properly (or, more accurately, if I could get Jetmail to work
properly, unattended, under MiNT) I'd be quite pleased to convert.

>but, for what I do, MiNT only very rarely gives me problems of
>any sort, and I use it almost all the time.

You're not running an autoamted mailer, are you?

>OK then, maybe what you are looking for is an .ACC, or maybe a

>double-clicks on certain file types, and the ACC could (I
>presume) play the sound without taking over the video. Not being
>a programmer, that's about as far as I dare go.

That would be a good solution - I'd say a CPX rather than an ACC, since
after all, there are only so many ACC slots, but the TSR/ACC option works
well for STiK.

So, the concept has developed to this point:

A TSR will load up and create a cookie.

Appropriate CPXes will load up and communicate with the TSR somehow,
possibly by adding more cookies.

When an unknown filetype is double-clicked, the TSR Will check to see if
it's a "known" type and, if so, pass it to the correct CPX; if not, drop to
the usual desktop routines.

Now the problem is finding someone who thinks it's worthwhile to program.

But that's exactly what I want to get away from, Lev. When running CAB, for example, when I click a link to a WAV file, I just want to hear the WAV, not see a blank screen (or even a description of the data) while it plays. ATM, clicking a WAV link leads to a complete redraw of the page after SWAV plays the sound.

Absolutely without screen display. An alert box if there's a problem is
acceptable IF and ONLY if it times out and goes away by itself after a few
seconds.

That would be good. Someplace around the house I have C source for a WAV
player - it need some work (doesn't handle stereo samples properly, for one
thing) but it would be another approach - if I knew enough C to do anything
useful with it. Guess that's my next project after the UUpoint gateway -
learning C properly. <SIGH> It never ends.

Why don't you make the code accessible so that other people who is interested
can take a look at it, even may implement something...

Here is what I normally do for web pages, I used the Netscape editor to create
a template - with all the tables, graphics position as I can see where they
all go in the page. After that I use a text editor for subsequent changes,
much easier. Downside is that you must know the language!

THIS IS THE FAIREST MOST HONEST WAY I KNOW TO SHARE THE WEALTH!

Hello!!

Would you like to make thousands of dollars, quickly, legally, with NO CATCH? Then keep reading.....please take five minutes to read this article- it will change your life, just like it did mine. It's true! you can make up to or over $50,000 dollars in 4-6 weeks, maybe sooner! I SWEAR I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're interested, keep reading; if you're not, I apologize for wasting your time.

Here we go, A little while back, I was browsing through these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars in weeks, with only an initial investment of $5! So, I thought, "Yeah, right, must be a scam".

but I was curious, like most of us, so I kept reading. Anyway, it said that you send $1 to each of the 5 names and addresses stated in the article. You then place your own name and address in the article at the bottom of the list at #5, and post the article in at least 200 newsgroups (there are thousands). No catch, that was it!

So after thinking it over, talking to a few people first, I tried it. I figured what have I got to lose except for 5 stamps and $5, right? Well, guess what....within 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But then money kept coming IN, tripling in size and

multiplying by 10-20 times the amount that I got the first week! In my first week I made about 2- to 30 dollars. But by the end of the second week, I had made a total of over $1,000!!!!!! In the third week, I had over $10,000 dollars, and it's still growing! This is my fourth week (Nov 13) and I've made about $42,000 TOTAL, and believe it or not the money is still coming in.....

Let me tell you how this works and most importantly, WHY it works...also, make sure you print a copy of this article NOW so you get the information from it, and begin making money.

The Process is very simple, and it consists of 3 EASY steps:

STEP 1: Get 5 seperate pieces of paper and write the following on each sheet of paper..."PLEASE PUT ME ON YOUR MAILING LIST". YOU ARE NUMBER 4. get five $1 bills, and place ONE inside each piece of paper that you have just written on, and fold each piece of paper so the bill will not be seen in the envelope (otherwise, nosey people who like to steal envelopes with money in it will get yours). Put one paper inside the envelope and seal it. Do the same for all 5. You should now have 5 envelopes sealed, EACH having a piece of paper and the $1 bill inside.

NOTE: make sure those words that were stated above are written on each piece of paper. What you are doing is creating a service by this.

This is PERFECTLY LEGAL. Now, mail the 5 envelopes with the paper and $1 in each to the following 5 addresses.

1. Bruce, P.I. Box 63 4700 Keele St., North York, Ontario M3J 1P3
2. Lars Westin Bjï¿½rkvï¿½gen 3 740 12 Knutby SWEDEN
3. D. Hill, 4280 150 6 Ave. S.W., Calgery, AB, Canada T2P 3Y7
4. Mattias W sernanders vï¿½g 1 rum 535 752 61 Uppsala Sweden
5. Jeff Boldrick, RR#2 Tweed, Ontario K0K3J0

STEP 2: Now take the #1 name off the list that you see above, move the other 4 names up (5 becoming 4, 4 becoming 3, etc.) editing what you need to edit.

STEP 3: Post your amended article (with your name at #5) to at least

200 news groups (there are around 10,000 of them!!). All you need is say, at least 200. HOW TO DO THIS: If you have netscape 3.0 do EXACTLY the following:

1) click on any news group like normal, THEN click on 'TO NEWS', which is on the far left when you're in the newsgroups page. This will bring up a box to type a message in.

2) Leave the newsgroup box as it is, but CHANGE the subject box to somehting eye-catching, like, "NEED CASH $$$ READ HERE" $$$ or "FAST CASH" !!!

3) Tab once and you should be ready to type. Now, Copy and paste or retype (only once)

THIS WHOLE ARTICLE, word for word, except to insert your name at #5, and to remove #1 off the list, plus any other small changes you think you need to make. Keep almost all of it the same.

4) When you're done typing(Copy/Paste) the whole article, click on FILE in THIS BOX,

right above send, NOT where it says netscape news on the first box. Click on SAVE AS when you're under FILE. Save your article as a Text file to our c: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTILL YOU HAVE SAVED IT. Once saved, move on to number 5 below.

5) If you still have all of our text. send or post to this newsgroup now by simply clicking send, which is right below AFILE, and right above the Cc: button.

6) Here's where you're going to post all 200. OK, click on any newsgroups then click on 'TO NEWS', again (in the top left hand corner of your netscape navigator. Leave the newsgroups box alone again, put your eye-catching title in the SUBJECT BOX, hit tab once you're in the body of the message, and then click on ATTACHMENT, which is below the subject box. You will get another box to come up. Click on ATTACH FILE, then find YOUR FILE THAT YOU HAVE SAVED; click once on this file, and then click OPEN. NOw click on OK. If you did this right, you

should see our file name in the attachments box, and it will be shaded green.

IF YOU USE I.E EXPLORER, IT'S JUST AS EASY: Holding down the left mouse button, highlight this article. Then press the "CTRL" key and the "C" key at the same, to copy this article. Then print this article for your records to have the names of those you will be sending $1 bills to.

Next, go to the news groups and press "POST AN ARTICLE". A window will open. Type in your headlines in the subject area and then click in the large windows below. If you want to edit the article, do so and then highlight and copy it again. Now everytime you post the article in a newsgroup all you have to reat is "CTRL" and "V" and press POST.

7) That's it! Each time you do this, all you have to do is type in a different newsgroup, so that way, it posts to 200 DIFFERENT newsgroups. You See? Now you just have 100 to go!! (Don't worry, each one takes about 30 seconds, once you get used to it). REMEMBER, 200 IS THE MINIMUM. The more you post, the more money you will make.

You are now in the mail-order business and will start receivng your $1 enveloopes from various people all over the world, within days! HINT: THE MORE NEWSGROUPS YOU POST TOK THE MORE MONEY YOU WILL MAKE.

You may want to rent a PO Box eventualy, because of all the mail. If you wish to stay anonymouse, you can come up with a name, such as "manager" or " investor". Just make sure all the address that you have typed in for the 4 people plus yourself are correct, please.

LET ME TELL YOU WHY THIS SYSTEM WORKS!

Out of every 200 posting, let's say I ONLY receive 5 replies, which is actually VERY LOW. So I made 5 dollars with my name at #5. Now, each person who just sent me $1 makes, say, only 200 posting, now with your name at number 4, WHICH IS A TOTAL OF 1000 POSTINGS, not including yours too. So people send you $1 now-that's $50 you have just made! Next, your new 50 agens each post 200 newsgroups with your name at number #3, or 10,000 POSTINGS (50x200 = 10,000). The average return is 500 at $1

each, so $500. They make 200 postings, which is 5,000 returns at $1 each, which is $5,000 dollars! and finally, 5,000 people make 200 postings with YOUR NAME AT NUMBER 1. YOU NOW GET A RETURN OF $50,000 BEFROE YOUR NAME DROPS OFF THE LIST. AND THAT'S IF EVERYONE ONLY MAKES 200 POSTINGS, AND IF ONLY 5 PEOPLE RESPOND!!!!!!

When your name is no longer on the list, you simply take the latest posting that is appearing in the newsgroups, and SEND OUT ANOTHER $5 TO THE NAMES ON THE LIST. PUTTING YOUR NAME AT #5 AGAIN. And start posting again. The thing to remember is, THOUSANDS OF PEOPLE ALL OVER THE WORLD ARE JOINING THE INTERNET AND READING THESE ARTICLES EVERY DAY- just like you are right now!!!

So can you aford $5 to see if it really works? I think so.....

People have said, "What if the plan is played out and no one sends you the money?"

So what! What are the chances of that happening when there are TONS OF NEW HONEST USERS AND NEW HONEST PEOPLE who are joining the internet and newsgroups every day and are willing to give it a try?

Estimates are at 20,000 to 50,000 new users, every day with THOUSANDS of those actually joining the internet.

Remember, PLAY FAIRLY, AND HONESTLY, and this WILL WORK, I promise you!!!! You just to be honest. Make sure yhou print this article RIGHT NOW.

Also, try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly.

REMEMBER: HONESTY IS THE BEST POLICY! You don't need to cheat the back idea is to make money!

GOOD LUCK TO ALL PLEASE PLAY FAIRLY, AND YOU WILL REAP THE HUGE REWARDS FROM THIS-TONS OF EXTRA CASH!!!!

One last note: If you try to deceive people by posting the messages with your name on the list and not sending the money to the poeple

already on the list you won't get much.

Someone I talked to knew someone who did that and he only made $150 dollars, and that's after seven or eight weeks! Then he sent the 5 $1 bills, people added his to their list, and in 4-5 weeks he had over $10,000!!!

THIS IS THE FAIREST AND MOST HONEST WAY I HAVE EVER SEEN TO SHARE THE WEALTH OF THE WORLD WITHOUT COSTING US ANYTHING BUT OUR TIME, $5 AND FIVE POSTAGE STAMPS!

Thanks for taking the time to read this message! This is about a lady that gave all she could to everyone, including me. Her name is Wendy.

When I was young she became my foster mother after my real mother had abandon me. Never having any kids of her own she became a foster parent. That I got to be in her care was probably the best thing that had ever happened to me. She had other foster children and even ended up taking care of many of the neighborhood kids.

Wendy is a lady that just never gave up and always gave more than anyone could imagine. I no longer think of my real mother as mother but rather Wendy as my only true mother. I know that I'm not the only one that thinks that way either. It wasn't just kids that she helped it included the elderly, the disabled and the just down and out. What it takes to qualify for a saint is something I never found out, but I know it can't be more than the things I saw this lady do for anybody. Even people that had wronged her could find themselves looking up at her while she helped them when they were down.

I'm 26 now and many of the things I'm telling you I never really realized until now. Since I was a kid she has helped me with everything from recovering from my mistakes to just being there to say "You can do it... It'll be okay." I've never been able to make a good attempt at trying to repay her for all she's done for me and I'm not alone. Many people just have taken for granted the things she's done for them.

I know by now you're asking yourself why I've posted this letter. Well, to be honest and straight with you it's because I would like your help. If there's one thing that I've learned from Wendy it's that, "We are our neighbors keepers." You know the golden rule, "Do onto others as you would have them do onto you." Anyway now Wendy is an older lady that is disabled and can't do as much as she used to. With the disability sometimes expenses can be too much. I now live in Arkansas and can't be of much help. With no real family I'd like to do something to try to repay all she done for me and many others.

That's were you come in. See if you can think back to someone that helped you no matter how big or small. Maybe it's someone you can't even remember or have lost touch with. For that moment picture Wendy and say, "I'd like to repay that kindness." I wish you would sit down and write a small note saying "Thanks for being the generous person that you have been!" If you could include something to help out. Maybe it's a five dollar bill, a book of stamps, even a dollar. Oh and would you also tell her the Steffin

sends his love. Her birthday is next month on the 27th and I m hoping
I can make this own a very memorable one.

Thanks for reading and if you choose to help God pless you.
Her address is

Well, if you had a DA which understood AV_START and simply played a the sample, this would work from within CAB. No problems. *Should* not cause CAB to redraw.

However, from Desktop, this is not the case, as it doesn't understand the AV protocol. Thing on the other hand...

>clicking a WAV link leads to a complete redraw of the page after SWAV plays
>the sound.

This could be CAB's fault. There are definately some redundant redraws there... I have never tried running an AV_START wav/avr player from CAB, but there should be no reason why CAB needs to redraw the screen.

That is wierd! Maybe it has something to do with the PC's partition that
Gemulator uses that are different from the ST's. I don't know exactly how GFA
detects EOF, but it may be flawed, which is causing your problem.

I guess you can do one of two thing:
1) Use a virtual hard disk image. (I don't know if the Gemulator Demo
supports this, but I think it does.
2) Read in and re-write the files under GFA Basic to fix that problem.

> I still
> wonder what this black bar means which continues to get smaller during

It's a memory test, you can hit the spacebar to quit it.

>
>This is my fourth week (Nov 13) and I've made about $42,000 TOTAL, and
>
>believe it or not the money is still coming in.......

Lets see, $32,000 in $1 bills in one week. That amounts to 32,000 letters. Since the post office does not deliver on Sundays, that means you received an average of 5,333 letters per day. If you sleep for eight hours a day, and spend the rest of it opening 5,333 letters, you would have to open one letter approximately every 11 seconds all day long without rest or food. You won't even have time to pay your bills or do other household chores. You'll also need to rent a truck to drive all that money to the bank and pick up your next load of mail because it will weigh about a ton. That means you'll need to cut into your sleep time and/or open the mail faster.

This is beside the fact that the bank, police, FBI, and the IRS will become very inquisitive over your repeated large cash deposits. Your home will probably be raided once or twice if not outright seized for probable cause of drug trafficing, money laundering/counterfitting, etc. The postmaster general will be after you to explain why you're suddenly getting so much mail. Somebody at the post office will go 'postal' because of the sudden manditory overtime to sort mail. The garbage collectors will fine you for

exceeding your weekly garbage limit, and much of it will remain on your lawn since they can't haul it all away. That means the city will be after you as well because of all the trash in your yard (not to mension that it hasn't been mowed in some time since you've been busy opening 5,333 letter a day). BTW, doesn't your finger get a bit sore and don't the papercuts hurt?

It goes without saying though, if you spam your message to 200 newsgroups, and only 15 people are dumb enough to respond and spam out another 200 messages per person, you will have ran out of news groups to continue the chain in. This is because there are only 3-4,000 newsgroups, not 10,000, and only about half of those see a significant amount of activity. Max profit for you is $15 income - $7 (investment + stamps/envelopes) = $8 net. Wow.

Your story is just a weeeeeee bit far fetched.

l > (binary OR in this case :-)

Sure. It waits until a button event occurs where
(button & bmask) == bstate
so set
bmask = bstate = 0;

It will then return on ANY button event. (Just ignore it if both
buttons are down.)

what do you mean "classic" BASIC? , and why do you say totally
useless, are you telling me that in ALL the time you have used
computers, from the very first day you set eyes on one, you have never
used a program written in BASIC?, maybe you used plenty but just did
not know it?,
I would say that posting a message in a programming newsgroup saying
BASIC is useless, when you have used software written in it, wether
knowingly or unwittingly, is a very sad case of using your gob when
your brain is dissengaged,

I have placed in my web page "10 tips to creating a web home page". This may
be helpful to you. It's based on a MS page but modified to be Atari friendly.

http://www.geocities.com/SiliconValley/6880/phsw.html

Have fun!

: But that's exactly what I want to get away from, Lev. When running CAB, for
: example, when I click a link to a WAV file, I just want to hear the WAV, not
: see a blank screen (or even a description of the data) while it plays. ATM,
: clicking a WAV link leads to a complete redraw of the page after SWAV plays
: the sound.

Ah, yes, but when using CAB you could call the forementioned hypothetical
accessory directly from CAB (CAB has AV capabilities, doesn't it?),
you wouldn't have to _start_ anything, so CAB just goes on running.
You just need a manager app of some sort to call the acc from the desktop,
as a "viewer". This manager would only have to pass the filename to the acc,
just as CAB would have to do...

OK, but I think that would overload the user a bit :) See that umlauts
are very common in german.

>: 2) Funny enough I can read all files from all partitions but GfA will

>find it...

Further tests gave a stunning result:
When I use the "Ataris-ST" drive mode so that all files are put into a
container, it works perfectly. Having a close look onto the files had
no result. I tried adding some characters, but it look slike gemulator
(or gfa basic) never ever recognizes the EOF of files which are among
dos files.

Just for info

Whoops, I missed a lot of this, but presume you are talking
emulators, and your keyboard works as English but you want German?

Well I had the opposite problem, when trying to type, I was getting
the German keyboard when I wanted English,

A small AUTO Folder program cured this, theres also a keyboard
manager cpx that lets you choose the keyboard language type thing and
set the keys,
I cant go into it too technically because I do not understand it, I
just know it works and offers a variety of languages,

CKBD is the name and found on most ftp sites,

HTH and if it doesent, then apologies for getting hold of the wrong
end of the stick..as they say :)

hehehehe.... Yea, but I dont keep the GEM-DEU source here at uni. :-)

Actually, now I think about it, I do! In my WWW pages, of course! Doh!

right, here it is...

event = evnt_multi(MU_KEYBD | MU_BUTTON | MU_MESAG,
0x102,3,0,
0,0,0,0,0,
0,0,0,0,0,
msgbuf,0,0,
&PointerX,&PointerY,&mousebut,&kbstate,&key,&numclicks);

Its the 0x102 which does it I think - setting the 0x10? flag makes and the
value of 3 is the important bit. (we are also detecting doubclicks)

Doh! how did I forget that... :)

Write two lines in APL and make the buggers run."

j > Hmm... CAB is written in Pascal!

Ah, that explains why it is so slow and buggy! ;-)

Where I used to work, the first (and last) time they tried to use
Pascal they had to go back and redo the whole project in another
language in order to get reasonable performance out of it.

<smile> I probably brought a lot of it on myself for starting the
thread, making a statement (that as yet no one has proved wrong<G>),
but I have to admit I did not see the point in ripping my programs
apart, when the way to handle the debate would have been to show me
better?, I honestly was not trying to say my programs where the best,
but to find out if anyone thought there was a better BASIC for making
games,
The thread got on some peoples nerves, although I dont see why,
theres a long and boring thread about mutitasking in c.s.a.st but I
suppose thats alright :)
Anyway after trying unsuccesfully to do whatever they where trying,
they have all gone off in a sulk, we can now safely say the thread is
dead if thats what everyone wants, and we will all just have to agree
that STOS is the best BASIC for making games in 1996 hehehehe

>Worst, they are critcizing the tool which is being used.

And they realy should have known better hehehehe

>Just my 2 cents.

Appreciated :)

Released this weekend, DIAMOND-ICE, already quoted as being ten times
better than Heartland :)

hehe! It's not _that_ bad because they all come with extensions to the
standard. Pascal was my first compiled language and I think traces of
it can still be seen in my C today. I'm not a fan of incomprehensible
rubbish when comprehensible rubbish will do!

>>Ada is dangerous.
>
> She is ??

Oh most certainly she is, yes. My "two lift" problem got sorted in
assembler quicker than in ada. ;-) It's a language that incorporates
multitasking constructs btw.

Hi, does the T-28 board switch back correctly to 8 MHz? My Turbo 20 board (very old product) doesn't swith back it's memory acces timing correctly. Memory acces is always like the shiffter is accessing video memory, even when it doesn't. This gives trouble with very tight timed programs like fullscreens demo's.

> The reason is simple: The sprite is wider than the raster of the
> playground!
> __
> ('')
> /( )\ <---- play character
> AA
> ########## <---- platform it is standing on
> I I I <---- raster width
>

Yes, this fix is also simple. Move the character about 6 pixels to the left and all is symetric again. The trouble is that the left hand of the character is algined with the raster and the character with is not a integer number times the raster width, causing a misalignment of the symetry axis of the character and (raster width)/2. However, moving the character about 6 pixels to the left will make the cahacter witdh 3 times the rasterwidth instead of two.

Tony Greenwood wrote:

> The difference between permanant and temp is that if you save your
> basic listing, the banks will save with it if permanant,

Ok, that's the way dat can be included into programs, you answered a question of mine before I could ask it, thank you.

> Reserve as screen = temporary screen
> reserve as work = temporary work area
>
> Then I can also reserve as music, charactor set, 3d, sprite
> and stos will know exactly what to do with them, it will allways know
> there start address and size and whatever

What is the difference between al those reserve commands? IMHO memory is memory. I don't see the need telling to computer for what purpose memory is reserved. The special thing about screen memory is that is has to be aligned on 256 byte boundaries, but I was told all memory blocks are reserved on 256 byte boundaries. Why differentiating in all those types?

>> think so. Does STOS automaticly alaign memory banks to 256 bytes
>> offsets so
>
> yes....so there!

OK, that's clear.

>> Scr=memory(64256) ' Get some memory
>> scr+=256 ' anticipate round down
>> scr=scr and $ffff00 ' get 256 byte boundary
>>
>> and thats the same as reserve as work 7,64256 hmmmmmmm?
>>
>> No, only the first line is. The second and third line are to make sure
>> my screens adress will be aligned to a 256 byte boundary.
>
> then IT IS THE SAME as all I need to do is reserve the bank and STOS
> does the rest....why didnt you beleive me?

Because it's unusual behavior for a memory allocationg command. Normally they alaing to 2 or 4 byte boundaries.

>> repeat
>> scrp=(scr and $ff0000) + ((scr and $ff00) shr 8) ' calculate
>> videobase lpoke $ff8200,scrp ' poke directly into hardware
>> register wvbl ' wait for vbl

>> scr+=1280 ' change offset
>> until(0)
>>
>> Mine is faster. And speed is al you need to get good arcade games.
>
> really, how the heck do you know ?????????????

Because every screensetting command has to do something like this. Calling a subroutine that calls an xbios command will be slower.

> I reserve all my banks and the rest in a routine called SETUP , the
> main loop that uses speed will not have any memory being reseved etc,
> you dont need that extra kick of speed until the main loop

I am not talking about the speed of memory allocation. I was talking about the speed of switching screens. You can use the fast way too in STOS. You have to be in supervisor mode, that's is no problem because heartland is working in supervisor mode so you either switched to supervisor mode, or STOS is always in supervisor mode. Yes, some poking has to be done, but poke is also a regular basic command, and it is faster, so why not use it?

>> STOS will, but does the hardware know? Does STOS start to move around
>> banks in
>
> yawn...how many times?

Well, as you don't have trouble my guess is STOS doesn't move it's memory banks when surrounding memoryblocks are released. Can someone confirm this?

>> As you told me I don't no how to program STOS, so I don't know how
>> your memset command is called. (Probably it depends on which extension
>> you use).
>

> extension? stop being a baby,

I guess there are a lot of extensions you can use for a lot of different things. So it's resonable to think there is more than one extension that supplies you with a command to set a block of memory to a cetain value. Maybe there are commands that lets you set memoryblocks with a 2, 4, 8 or 16 byte value. You have to be able to differentiate between the commands in different extensions. So how is this done? How are new commands added to STOS? How do I make sure the command name is already in use by someone else?

> Well you got that right!...I had absoloutly no idea what your list of

Please, I explained you why I was using pokes: I don't know the memset() command in STOS, so I used pokes because that command is supported in all basics.

Yes.

> talk to yourself until you actually win a debate, probably take you
> ages hehehe

I am not trying to win a debate in this thread. I am just curious about a programming language that I don't know. I'd like to know how certain commands work. I like to know how things work.

What happends when you are tying te reserve memory when no memory is left? (C returns a NULL pointer, Omikron basic generates an 'Out of memory error.)

Hi, I know that you can boot Magic PC with any OS image in the range TOS 1.00
to 2.06. There are even two different ways to do it:

Replace the file MagiC_PC.OS with the TOS image you want to boot from

or

Insert the TOS image you want to boot from as the file ROM.OS. When booting
Magic PC it first looks for the file ROM.OS and when found it will boot from it.
When ROM.OS is not available it will look for the file MagiC_PS.OS and use that
one to boot.

Maybe you can test the resolution in your next game and print a message saying
the game only works in ST LOW instead of locking up the system?

> dispute its there or question your comments, either of you, juts
> simply to say, cannot see it ?

Did you check the archive? It might be a broken file in the archive.

> STOS BASIC, they are not STOS BASIC commands and as far as I am ware
> are not mentioned in the STOS BASIC user manual?

No, but they are mentioned in every ST programers manual. You can use the bios
and xbios functions with STOS, so see them as etensions to the language.

>> Most of them have extended graphic hardware, the only access to

>> ATARIs (ST/STe/TT/FALCON without extensions).
>
> without extensions? what on earth does that mean ?

He means extensions like videocards, turbocards, exotic memory cards and all
other thing you can add to a normal ST, so an Atari without
extensions is an Atari like you have, no modifications.

> the thread is best BASIC for games ??????? why do people have to
> start prattling on about applications and anything else they can
> think of because they are too scared to admit they cannot fault my
> original statement,

We said your original statement was false because STOS can't do GEM games. You
said no one wants GEM games because you think they are slow and nonresponsive
(just like we thought about STOS). We are proving there are lots of people
wating GEM games. Try to get a copy of Kubis '96 or WinColTris to see a mordern
GEM game.

> Ok I never said my games where fanatastic, I said STOS is the best

Do a Web search for WAVEPLAY - that's where I found it. John Curtis added a GEM front end to it and compiled it to WAVPLAY2 (look at my ftp site), but it doesn't do stereo. Otherwise, it seems to be just about he best WAV code there is. Ned's Player has a better interface, though, and many more file types.

If it's not "quick" (as compared to C, Assembler, Pascal, or whatever), then there's no reason to use BASIC in any flavor. AFAIAC, the whole point is writing a program in a language that actually makes sense to me days later., so that I can figure out without running a half-dozen debuggers/system monitors what's wrong, make the (hopefully minor) changes, recompile, and re-test it in a few minutes.

And it's still advocacy.

>computers, from the very first day you set eyes on one, you have never
>used a program written in BASIC?, maybe you used plenty but just did
>not know it?,

I used BASIC in various incarnations from 1984 to 1992, including STOS.
I wrote some programs too (A diskzine-shell, a couple of demos and some
programming-utilities.) in STOS and at that time I liked it. The
reason I abandonded STOS was that it couldn't do what I wanted it to
without some serious hacking. And I'm not talking about sprites and
stuff here, I wrote those parts in assembler anyway (This was before
all those cool extensions.).

I'm a fan of clean and structured programming; no way you can accomplish
that with STOS. I mean, just look at those line-numbers! Show me a
10000-line *structured*, easy-to-read source in STOS! Let's face it,
the programming-language itself is crap. No procedures, no functions
and no dynamic datastructures (No datastructures at all except for
arrays.). (BTW. this is what I mean with "classic BASIC".) If STOS had
looked anything like AMOS on the Amiga (It was awesome!) we wouldn't
have this thread today.

> I would say that posting a message in a programming newsgroup saying
>BASIC is useless, when you have used software written in it, wether
>knowingly or unwittingly, is a very sad case of using your gob when
>your brain is dissengaged,

Perhaps you should try looking outside the (very) small world of BASIC
and see what else is out there. You're obviously a very skilled
programmer (I've seen a couple of your games and they were cool!),

if you spent some time learning a more powerful language you could write better games in the same or less amount of time you use now.

The time you save by being able to write one line of code instead of three to plot a sprite is quickly consumed by the additional time you use to maintain large sources with line numbers, goto's and gosub's.

Your original posting said something like "STOS is the best BASIC to write games with", and that's correct. But you included C too, which is more powerful than STOS no matter what you say. You claim that you write your games in ("Upgraded") STOS. OK, if I wrote a library like "Missing Link" for C, could I write a game with it and claim that I use nothing but "upgraded C"? I couldn't, 'cause I used C and an additional library, just like your extensions. They're not a part of the language, and no sane person would say that the language BASIC is more powerful than C??

Well, actually, the first bar is a memory test. The second bar is a built
in delay to allow older hard drives to come up to speed before continuing
the boot-up process...In any case, he is right--just bash a key to carry
on... :)

I own many games written in 1990 and earlier, and they run from HD and
makes no trouble with my T-28. On the contrary, they peform much better
with 28 MHz. (Civilization, Elite II Frontier, Transarctica, Power Monger,
Popolus, Ishar)
Of course there is another diference to yours, these are not free games.

>>- If I start the games not from ST low (I use usual ST high or better) the

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
GOTCHA!!!

So tell me how do you would switch resolution from:

- ST low with AS OverScan (368x264x16) to ST low (320x200x16)
- ST mid with AS OverScan (704x264x4) to ST mid (640x200x4)
- using a graphic card: from 640x480x16777216 to 1152x832x256

(AS OverScan is a small hardware extension for all 260/520/1040 ST/Mega ST)

>>without extensions).
>
> without extensions? what on earth does that mean ?

For example graphic extensions like AutoSwitch OverScan (for ST), VME bus
graphic cards (for Mega STe/TT), BlowUp (for FALCON).

I hope that I can install a 1 MB ISA graphic card next week into my Mega ST.
Then I'll be able to use 1280x1024 pixel in 16 colors or 1152x832 pixel
in 256 colors or 832x624 in 65536 or 640x480 in 16.7 mill colors.
That's nearly the same like your W95 PC graphic capabilities.

To be on topic:

The only way to display anything on these graphic extensions is VDI/GEM.
And STOS is not able to use VDI AVAIK.

Here are some quotations from the ATARI Compendium:

------ 1.6 Atari 'clone' Computers ------------
Atari 'clone' computers first became available in early 1994. These
computers, while mostly software compatible with Atari-produced
computers, contain hardware enhancements and modifications that may
cause incompatibilities in software that relies on hardware access rather
than the recommended method of using standardized OS calls.

The recent availability of these computers as well as enhanced graphics and
peripheral boards amphasizes the value of programming using the OS whenever
possible to allow software to be run on the widest variety of machine
configurations.

---------4.3 XBIOS - Overview --------------------
...
Some functions (notably video hardware and storage device related functions)
should only be used by device drivers and system level software as they
represent a non-portable method of hardware interaction which may be
unsupported in future Atari computers.

As a general rule, GEMDOS and VDI functions should be used, when possible,
rather than XBIOS calls. The GEMDOS and VDI provide a software abstraction
layer which will make software applications much more compatible across
new computer releases.

> Ok I never said my games where fanatastic, I said STOS is the best
>BASIC for making games on the ATARI in 1996,
>
> NO ONE has done anything to prove otherwise, you have all TALKED
>TALKED TALKED

Maybe STOS is indeed the best BASIC for making games for the atari _ST_,
but there are a lot of other ataris. (Which are not or not full supported.)
And that is the bad part of your STOS games.

> None of you can show me a game written in BASIC thats better than
>STOS ones, it is childish to start trying to find bad things in my
>games, show me something better, thats the whole point, or dont you
>all understand ?????

OK. I will write a game. It will support extended resolutions.
Can you beat this special feature with STOS?

>>Just seen yesterday. The only difference is speed. A PowerMac 8500 or a
>>Hades 060 is more than 20 times faster than a 8 MHz ST.
>
> and your point is what ??? would it have anything to do with making
>games in BASIC, I think not :(

A faster CPU can compensate slow code. GEM code is mostly slow code.
To make good GEM games, you can compensate the slow but compatible
GEM code with a faster CPU.

>>There is no choice between GEM games and none GEM games, because you can
>>only run GEM games on the new powerfull atari compatible computers!
>
> really? I think you will find you are WRONG

OK. So tell me some STOS games that will run on my ST at its extended
resolutions or on the mentioned Perfoma 460 (832x624x256). I've tested
many GEM games successfully.

>>Tony: Why do you dislike GEM? Have you ever worked on a "big" atari?
>> (A simple falcon is not a big atari to me.)
>
> I have a STe...thats it, no falcon, no hard drive, i dont even have a
>drive B? i have the original atari mouse and a joystick and ONE box of
>disks, thats my total atari set up,

That's overhelming! You can code without any monitor! ;)

>I manage to make reasonably good
>software thats quite well recieved in the ATARI community, beleive me
>its not that easy with such a bare minimum set up,

Serious: Compliment to you.

> SO no i havent "worked" on a big atari, in my book this is big:)

Indeed, it is. I hope you can use some time a big atari, to make
very good games.

> why do all gem programmers think there is only red,green white and
>black, surely they can change the colours here and there,

Most of them have a monochrome monitor.

>I have made
>some serious software in medium rez, and they "look" quite nice, I
>made angled scroll bars with shape and depth, 3d boxes etc,
> Nagggh I definatly dont like GEM its boring IMHO:)

How look your colored software at a monochrome resolution like ST high?

You've asked for the best BASIC for making games in 1996, so please
refer to a GEM of 1996. The actual GEM offers you much more than
scroll bars with shape and depth or 3d boxes. The GEM of your 1040 STe
is from 1990!

>
>>BTW: Is there any (GEM) monopoly game around?
>> In case there's no one, I'm forced to write my own...
>
> in BASIC ? :)

In C. I have no BASIC which is 100% GEM compatible.

Something like that..If you have the ability to run the game by
booting some other way, then why boot in the way that makes it crash,
seems a bit silly to me?

>Using your words: "The thread is best BASIC for games"

>Can a Programming Language be the best of all, if the resulting program
>won't run on new ataris? Hhmmm....

YES, when there is nothing better about?, a game made in BASIC that
works on most ATARIs is better than a none existant game, how many
ATARIs will that work on, no game=no ATARI's...yes?

>>dispute its there or question your comments, either of you, juts
>>simply to say, cannot see it ?
>
>I just started Heartland 5 times, I can see the bugs every time!

As the program is pure code, and all the data is on disk, dare I
suggest the zip might have been damaged, or....maybe your display is
far superior to mine?

>> I have commands to not only find the current resolution, hertz rate
>>etc, but I can also switch resolutions as much as I want,
> ^^
>GOTCHA!!!
>
>So tell me how do you would switch resolution from:
>
>- ST low with AS OverScan (368x264x16) to ST low (320x200x16)

You see I am talking about the majority, are you seriously trying to
tell me you do not have access to ATARI ST low rez, if you have, then
whats the problem ?

>>>Your wonderfull STOS games are not running on this nice big ataris!
>>
>> hang about, whats all this "your wonderfull stos", if you are trying
>>to be sarcastic then this is all a waste of time :(
>>
>>>Most of them have extended graphic hardware, the only access to screen

But also have the ability to use ATARI ST low, so ????

>To be on topic:
>
>The only way to display anything on these graphic extensions is VDI/GEM.
>And STOS is not able to use VDI AVAIK.

But why would I want to use those resolutions, If you have access to
st low, and if you havent? then you show me a game made in basic that
is using them that was programmed in 1996, and will work in atari low
as well ?

>> NO ONE has done anything to prove otherwise, you have all TALKED
>>TALKED TALKED
>
>Maybe STOS is indeed the best BASIC for making games for the atari _ST_,
>but there are a lot of other ataris. (Which are not or not full supported.)
>And that is the bad part of your STOS games.

nooo you are missing the point and straying from the whole thread, it
is not good enough to tell me how bad stos is, it is pointless telling
me the flaws of which I am already aware, there is certainly nothing
to be gained from publicly attacking my software,
for my statement to be wrong, you have to show me better ? but you
cannot, so even though STOS does addmitedly have drawbacks, and STOS
may not be the best all round BASIC for the ATARI and my games may not
be the best in town, until you show me better, written in BASIC in
1996, then my statement is proven to be true?

>OK. I will write a game. It will support extended resolutions.
>Can you beat this special feature with STOS?

I am sorry, but I do not believe you will write a game that will work
on every single ATARI, including my humble setup and your highest

spec, and someone, anyone say, hey what a good game, and be in BASIC
only,
I am not saying you are not capable, I presume you are, you probably
have the ability and the software to make something spectacular, I am
saying that i doubt you will, and would go so far as to say I am
absoloutly sure you wont be able to make one that will prove my
original statement wrong :) hehehe, you may want to recap the original
statement before you start, a quick glance at the calander would
suggest you only have a matter of weeks to do it in, <smile>

>>>Just seen yesterday. The only difference is speed. A PowerMac 8500 or a
>>>Hades 060 is more than 20 times faster than a 8 MHz ST.

>> and your point is what ??? would it have anything to do with making
>>games in BASIC, I think not :(

>A faster CPU can compensate slow code. GEM code is mostly slow code.
>To make good GEM games, you can compensate the slow but compatible
>GEM code with a faster CPU.

Since when has a powermac been an atari ?...and dont you draw the
line anywhere? how about a jaguar, thats atari,

>>>There is no choice between GEM games and none GEM games, because you can
>>>only run GEM games on the new powerfull atari compatible computers!

>> really? I think you will find you are WRONG

>OK. So tell me some STOS games that will run on my ST at its extended

I did not say STOS would do it, I said I think you are wrong?

>> I have a STe...thats it, no falcon, no hard drive, i dont even have a
>>drive B? i have the original atari mouse and a joystick and ONE box of
>>disks, thats my total atari set up,

>That's overhelming! You can code without any monitor! ;)

doh!...whoops :)

>> SO no i havent "worked" on a big atari, in my book this is big:)

>Indeed, it is. I hope you can use some time a big atari, to make
>very good games.

well I think you stated a falcon is not big in your eyes, but that is
something I would like to do, hopefully this does not sound big
head'd, but I really do believe I could make some really good software
on a falcon, most of the commands I have available now have already
been converted to work on the falcon, STOS on the falcon will access
most of what it has to offer, all that speed, true colur sprites d..
ho there i go again, drooling...it may never happpen though :(

>> why do all gem programmers think there is only red,green white and
>>black, surely they can change the colours here and there,

>Most of them have a monochrome monitor.

haaa, fair comment :)

>>made angled scroll bars with shape and depth, 3d boxes etc,
>> Nagggh I definatly dont like GEM its boring IMHO:)

>How look your colored software at a monochrome resolution like ST high?

Dunno, I have not got a high rez monitor, mine is an old atari colour
monitor that has no side borders, cant get it fixed:(, means the
first8 pixels of the screen and the last 8 are hidden :(, thats why
you wont see much happening at the edges of my software :), seriously
:)

>scroll bars with shape and depth or 3d boxes. The GEM of your 1040 STe
>is from 1990!

i dont see the relevance? my software still boots up and runs, and
until you show me a game made in 1996 in BASIC, then I am afraid STOS
and its old techonology are still the best in town :)

>What is the difference between al those reserve commands? IMHO memory is
>memory. I don't see the need telling to computer for what purpose memory is
>reserved. The special thing about screen memory is that is has to be aligned on

Eeerm, for the follow up commands, the best way to explain...
Later on I may want to use a command like....MUSIC 3
STOS will automatically look in the bank I assigned as music, this
saves me having to add perameters to the music play command,
This is the same for fonts used in windows, sprites etc,

> > then IT IS THE SAME as all I need to do is reserve the bank and STOS
> > does the rest....why didnt you beleive me?

>Because it's unusual behavior for a memory allocationg command. Normally they
>alaing to 2 or 4 byte boundaries.

hmmm I can only presume its easier for STOS? Dunno realy, having
never used other programming languages to the extent of memory
allocation, then I never questioned the way STOS does it?,

> >> STOS will, but does the hardware know? Does STOS start to move around
> >> banks in
> >
> > yawn...how many times?
>
>Well, as you don't have trouble my guess is STOS doesn't move it's memory banks
>when surrounding memoryblocks are released. Can someone confirm this?

It does, eeerm I think we may have lost track of each other here, but
let me give this a shot:)

If I assign a variable to = the start address of a memory bank, eg
S7=start(7)
Then at some point another bank is erased or made? then S7 will no
longer = start(7) and the variable must be reset by the programmer,

BUT!..if I use STOS commands, eg screencopy 7 to physic, well I can
use that in a loop all day and erase or make banks all I want, STOS
will keep track of bank 7,

As for screens.....we would not usualy use a bank, screen areas are
already set, PHYSIC,LOGIC and BACK, Logic being the screen your work

is allways performed on unless told otherwise, so print "Tony" will
allways go to the logic, a good programmer will allways set logic to =
back, so work is hidden, then a screenswap command will swap the
logic,physic, = instant graphics as no data is moved, only a pointer
changed, I cannot see anything being faster? logic can be set to
anywhere, back, physic a bank, anywhere......

> > Extensions are upgrades to STOS programming launguage , just like any

>I guess there are a lot of extensions you can use for a lot of different

>supplies you with a command to set a block of memory to a cetain value. Maybe

All the memory allocations are done with STOS original commands,
well in my work, I cant speak for all STOS programmers:), but I do not
recall any commands in any extension for allocating memory, unless the
termonolgy is confusing me:)

>there are commands that lets you set memoryblocks with a 2, 4, 8 or 16 byte

Unfortunatly the STOS memory banks not only round off 256, but have a
minimum size of 256? or is it??, ho dear, all this off the top of my
head?,

>value. You have to be able to differentiate between the commands in different
>extensions. So how is this done? How are new commands added to STOS? How do I
>make sure the command name is already in use by someone else?

extensions are obviously not made in STOS, so i cannot help you
there, I know a certain amount, but it could be the blind leading the
blind, making extensions is well out of my luegue i am afraid,

> > talk to yourself until you actually win a debate, probably take you
> > ages hehehe
>
>I am not trying to win a debate in this thread. I am just curious about a
>programming language that I don't know. I'd like to know how certain commands

My apologies, I found it difficult to seperate the two threads, ie
STOS and this one, SORRY :)

>What happends when you are tying te reserve memory when no memory is left? (C
>returns a NULL pointer, Omikron basic generates an 'Out of memory error.)

STOS returns error 8, out of memory....
But STOS has amongst its nifty commands and preset variables, free,
so print free return the available memory, you can allocate a bank
with "reserve as data 7,free" although free-1280 or simmilar might be
a better idea:)

Well, I wasn't expecting so much response. Thanks for all the help. To tell you the truth the day after I posted the message I went home found the bug and fixed it. I was using GFA Basic. The problem involved the passing of information for XBIOS 32 format sound between procedures. It wan't noticed on the STE because this was not being used most of the time. Anyway thanks for your replies. Next time I have a problem I'll see if I can sort it out first, then if not I'll give more info in my message to this newsgroup. Cheers.

Dan Jones.

>boundaries. Why differentiating in all those types?

Ever heard of type checking? this is rather simular. Reserving as a character
set tells STOS what you are using it for, so it can tell you if you do something
silly.

What is the difference between these in C?

```
char *a;
float *c;
void *d;
```

They are all pointers to memory, but have a different 'type'.

>in supervisor mode, that's is no problem because heartland is working in
>supervisor mode so you either switched to supervisor mode, or STOS is always in
>supervisor mode.

STOS is always in supervisor mode.

>Yes, some poking has to be done, but poke is also a regular
>basic command, and it is faster, so why not use it?

Because it is less eligent? Yes, using OS calls is slightly slower, but it
is much neater, and easier to read (an important issue in programming large
progs...) Oh, and as you previously brought up Hades etc. you cannot
gaurentee that it will work...

>Well, as you don't have trouble my guess is STOS doesn't move it's memory banks
>when surrounding memoryblocks are released. Can someone confirm this?

I dont know exactly what it does, but it doesn't seem to move the banks
around in my progs... I haven't examined its behaviour in too much detail
because I dont tend to do things like erase/reserve banks appart from in
the initialisation stages...

>value. You have to be able to differentiate between the commands in different
>extensions. So how is this done? How are new commands added to STOS? How do I
>make sure the command name is already in use by someone else?

You cannot - it is up to the extension programmer to come up with unique names.
(which is why I have all existing extensions installed so that I can recognise
clashes - there are none at the moment)

There is a symbol table at the beginning of each extension which gives the
command name, and a byte 'token' which is used to ID the command. STOS
internally has a second byte which identifies the extension.

>What happends when you are tying te reserve memory when no memory is left? (C
>returns a NULL pointer, Omikron basic generates an 'Out of memory error.)

STOS generates an error (suprisingly 'Out of Memory'). This can be caught
by your program using the 'on error goto' command, which may handle the
error in anyway it considers fit, and then if possible 'resume'.

I'm sorry, but I have to point out that this is wrong.

STOS games can work on the Falcon - I am writing games for/on it! (go to
http://www.cs.man.ac.uk/~jacquesa/tron2000/ for a sneak preview - but no
demo yet).

Also, the reason STOS does not work on TT's is because I have no DEF030x.DAT
files for the Generic Fixer (ie. it cannot fix for TOS 3.0x). This is due
to the fact that TT owners completely ignored my repeated requests (on this
and other newsgroups) for someone to spend 5 minutes creating these files
for me.

Obviously TT owners are not interested in playing games, as they would have
contacted me if they were!

>I translate it as:
>
>"Don't start STOS games on new atari's because they will crash!"

Why? All 'new' atari's support ST-low. Just hold down CTRL when booting and it should default to ST-Low. (or at least, my Falcon does). Where is the problem with this? Games shouldn't really be run ontop of NVDI, MultiTOS, loads of DA's etc. - you SHOULD clean boot anyway. (this isn't just STOS games btw. Comercial games such as Zero-5/Robinsons Requiem [falcon] recommend this...)

>Can a Programming Language be the best of all, if the resulting program
>won't run on new ataris? Hhmmm....

I dont know where you got this from - All atari's should be able to access ST-low (unless you only have mono monitor, of course :)

>>>memory. This is fast, but will only work on original ATARIs (ST/STe/TT/FALCON
>>>without extensions).
>>
>> without extensions? what on earth does that mean ?
>
>For example graphic extensions like AutoSwitch OverScan (for ST), VME bus
>graphic cards (for Mega STe/TT), BlowUp (for FALCON).

Yea, I agree that STOS probably wont work with these, but I can garantee that it does work with the BlowUP 1-hardware on the Falcon (as part of my FX card). And yes, you can even make use of it - I have written myself a .TGA viewer which uses 640x480xTCxVGA mode and hardware scrolling for big images...

>To be on topic:
>
>The only way to display anything on these graphic extensions is VDI/GEM.

That sounds like a Micro$oft approach to me...

>> why do all gem programmers think there is only red,green white and
>>black, surely they can change the colours here and there,
>
>Most of them have a monochrome monitor.

No, I would have said that it is they dont want to change the system
palette (this is 'bad form' ISTR the Atari Compendium saying not change
the bottom 16 colours as these are for the system...)

"we".....you have a twin maybe ? :-)
So you think the only good game is GEM game, hahahaha thats silly!

>said no one wants GEM games because you think they are slow and nonresponsive
>(just like we thought about STOS). We are proving there are lots of people
>wating GEM games. Try to get a copy of Kubis '96 or WinColTris to see a mordern
>GEM game.

no I did not quite say that, a game does not have to be GEM
compatable to be good, as soon as you realise that, then we can move
on, all atari computers should have the ability to run in atari st
low, so........

> > Ok I never said my games where fanatastic, I said STOS is the best
> > BASIC for making games on the ATARI in 1996,
>IF you don't want to make GEM games and don't care about the fact the game
>doesn't run on a TT and the game will only run on a Falcon using
>backwards.

eerm your falcon statement is totally totally false, in fact its
total rubish, MY games need backwards, but we are talking about STOS
BASIC not my games, STOS can be used to make Fully Falcon compatable
games, STOS can be used as you will see in another posting in here for
a lot of nice falcon things, without backwards ?
I can and indeed have made software in STOS that runs on the falcon,
without backwards, just not games, I can support TOS 401, 402, 404 and
492

> >> There is no choice between GEM games and none GEM games, because you
> >> can only run GEM games on the new powerfull atari compatible
> >> computers!

> > really? I think you will find you are WRONG

>Your game doesn't work...

I Know, but we are not talking about MY games, and in this instance
we are not even talking about STOS, a statement was made that only GEM
made games will run on the new powerfull ATARI's, and I doubt that
very much,

Tony Greenwood (stosser@airtime.co.uk) wrote:
:
: no I did not quite say that, a game does not have to be GEM
: compatable to be good, as soon as you realise that, then we can move
: on, all atari computers should have the ability to run in atari st
: low, so........

If you have a graphics-card or any of the new clones you can't use ST-low.
The main problem is that the ST use bitplanes whereas all graphics-card
use chunky mode. If you don't want to write routines specifically for each
type of graphics-card, the only solution is to use VDI. It's quite
acceptable on faster machines, but not on ST's. Forget it. GEM is OK for
games that doesn't require speed and complex graphics but not for
arcade-games.

However, if you don't fix STOS-games (That's designed to run on ST's.)
they won't work on Falcons even if they're running in ST-Low. Wouldn't it
be a solution to somehow include a generic STOS-fixer in the game itself
(It obviously has to run before the compiled STOS-code is executed.)
so that the user don't have to do this? This way the game should be able
to run on about every Atari out there that can use ST-Low.

I tried AMOS, maybe it was the machine I didnt like working on, or maybe too long in STOS, but I definatly did not like AMOS ,

>> I would say that posting a message in a programming newsgroup saying
>>BASIC is useless, when you have used software written in it, wether

>Perhaps you should try looking outside the (very) small world of BASIC

For what ?, why would I want to when BASIC is doing everything I
personally ask of it ?

>and see what else is out there. You're obviously a very skilled
>programmer (I've seen a couple of your games and they were cool!),

<blush> ta :)

>if you spent some time learning a more powerful language you could
>write better games in the same or less amount of time you use now.

But would I enjot it? you see I have looked at C and tried a couple
of tutorials and I simply didnt like the look of it, assembler looks
even less enjoyable, I liked the little play around I had with Pascal
and indeed am awaiting a copy of Personal Pascal as we speak,
I have recently aquired hisoft2 basic and gfa 3.5, I am looking to
make a serious application that needs GEM you see <duck!>
But would not even contemplate making a game out of any of them,

>The time you save by being able to write one line of code instead of
>three to plot a sprite is quickly consumed by the additional time you
>use to maintain large sources with line numbers, goto's and gosub's.

eeerm sorry? I did not understand that last statement, serious ?

>Your original posting said something like "STOS is the best BASIC to
>write games with", and that's correct. But you included C too, which
>is more powerful than STOS no matter what you say. You claim that you

The point I was trying to make, was that if someone wants to make a
game now, then the best software, up to C that they could use is STOS
BASIC, it is something I believe and stand by,
The original statement was to, start a thread in an otherwise empty
and boring newsgroup :), have a healthy debate with other BASIC coders
and generally liven things up, it was not designed to upset people or
make enemies,
NOTHING has been said to make me even consider retracting my original
statement, maybe if someone shows me something instead of trying to
tell me ? :)...but of course that cannot be done, thus strenghning my
beliefs,
BTW this was never intended to be about MY software, but about STOS
BASIC, I merely used mine as examples as it would not be fair to use
other peopels un invited,

>write your games in ("Upgraded") STOS. OK, if I wrote a library like
>"Missing Link" for C, could I write a game with it and claim that I
>use nothing but "upgraded C"? I couldn't, 'cause I used C and an

haha you are joking?

>additional library, just like your extensions. They're not a part of
>the language, and no sane person would say that the language BASIC is
>more powerful than C??

You are making 2 points here, the last I agree, I never said or even hinted that BASIC is the most powerfull language, I already wrote that other languages are more powerfull and I think I even used the termanology you just did and said...only an idiot would... C is more powerfull, I know that.....but that still does not alter the fact, just because something is more powerfull then it doesent mean its the best tool for the job,

Your first point however falls flat on its face and you are falling into the same trap everyone else seems so intent on doing,

The original authors of STOS BASIC made it in such a way that when it would need upgrading, they could add the commands by way of extensions, you add these to your programming folder that holds the original commands, they are extra commands loaded into your language disk, they are not programming libraries, they are upgrades, STOS BASIC LANGUAGE UPGRADES,

This is the problem, some of you think of them as libraries and make comparisons with C libraries, thats rubbish, you have to realise that extensions are language upgrades, therefore if I use extensions, I am making my game in STOS BASIC, nothing more nothing less, but I do point out that it is a much upgraded STOS BASIC,

Thanks for taking the time to read this message! This is about a lady that gave all she could to everyone, including me. Her name is Wendy.

When I was young she became my foster mother after my real mother had abandon me. Never having any kids of her own she became a foster parent. That I got to be in her care was probably the best thing that had ever happened to me. She had other foster children and even ended up taking care of many of the neighborhood kids.

Wendy is a lady that just never gave up and always gave more than anyone could imagine. I no longer think of my real mother as mother but rather Wendy as my only true mother. I know that I'm not the only one that thinks that way either. It wasn't just kids that she helped it included the elderly, the disabled and the just down and out. What it takes to qualify for a saint is something I never found out, but I know it can't be more than the things I saw this lady do for anybody. Even people that had wronged her could find themselves looking up at her while she helped them when they were down.

I'm 26 now and many of the things I'm telling you I never really realized until now. Since I was a kid she has helped me with everything from recovering from my mistakes to just being there to say "You can do it... It'll be okay." I've never been able to make a good attempt at trying to repay her for all she's done for me and I'm not alone. Many people just have taken for granted the things she's done for them.

I know by now you're asking yourself why I've posted this letter. Well, to be honest and straight with you it's because I would like your help. If there's one thing that I've learned from Wendy it's that, "We are our neighbors keepers." You know the golden rule, "Do onto others as you would have them do onto you." Anyway now Wendy is an older lady that is disabled and can't do as much as she used to. With the disability sometimes expenses can be too much. I now live in Arkansas and can't be of much help. With no real family I'd like to do something to try to repay all she done for me and many others.

That's were you come in. See if you can think back to someone that helped you no matter how big or small. Maybe it's someone you can't even remember or have lost touch with. For that moment picture Wendy and say, "I'd like to repay that kindness." I wish you would sit down and write a small note saying "Thanks for being the generous person that you have been!" If you could include something to help out. Maybe it's a five dollar bill, a book of stamps, even a dollar. Oh and would you also tell her the Steffin sends his love. Her birthday is next month on the 27th and I'm hoping

I can make this own a very memorable one.

Thanks for reading and if you choose to help God pless you.
Her address is

Wendy Mcghee
9636 Elm
Taylor, Mi 48180

The latter is true, it wasnt available,

But you are being a bit pre emptive with Diamond-Ice? it isn't even
released yet, and NEWS!!! I have fixed it and Flinny tried it on his
Falcon TOS 4.04 and it works, So Diamond-Ice will be released as
Falcon Compatable,
Anthony, theres also an improved Sample that will play on the Falcon,
and any Ste with more than one meg :), the only thing that will be
missing on the Falcon version is the very nifty intro routine :)

(Yes Backwards and ST Low will be needed<G>)

Pascal was designed to teach programming, it was never ment as a
programming language to do real programming with. (Real programming is any
programming that solves problems exceeding the level of problems
encountered in the regular 'programming for beginers' courses.

>>
>> HO SHIT!!! I just ordered Personal Pascal :(.....I did!

Hey, I thought you could already program?? Ah, now I remember, you never picked
up the use of funtions. Though I think it's a bit of over kill to buy pascal for
that purpose. ;-)

> hehe! It's not _that_ bad because they all come with extensions to
> the standard. Pascal was my first compiled language and I think traces
> of it can still be seen in my C today. I'm not a fan of
> incomprehensible rubbish when comprehensible rubbish will do!

That's exactly what makes pascal bad as a real programming language. ISO Pascal
(the official standard pascal), is a cripple language, not usable for real
programming. To make Pascal more usable people made extensions to the standard,
but the problem is that different pascal versions are extended in their own
particular way, so those versions are incompatible with each other.

If you are sure you are going to use that compiler the next couple of years
there is no problem with that, but if your program should be compiled on
different systems. The programming project I am working on compiles on multiple
platforms with different compilers (TOS: Pure C and GNU C; Linux (68k and ix86):
GNU C; DOS: Watcom C and Microsnot C). (Be warned, using C doesn't mean it's
portable, but it is possible to write portable code.)

Even the designer of pascal, Nicklaus Wirth, agrees with the fact that pascal
is not usable to do real programming that's why he designed
Modula 2. That language is able to handle real life problems. I don't like that
language though.

>>> Ada is dangerous.

So memory banks are very thight coupled with the command set. How does this affect new or improved commands?
Example: I want to use a Digmax tune or a Countzero tune, these music types have to be initialized and played in a different way (if I remeber it correct, there are a lot of different chip music formats.)
Same thing for a sprite routine. How is a bank matched to the right sprite routine?

> hmmm I can only presume its easier for STOS? Dunno realy, having
> never used other programming languages to the extent of memory
> allocation, then I never questioned the way STOS does it?,

Seems so. Creating a lot of trouble to understand each other.

>> Well, as you don't have trouble my guess is STOS doesn't move it's
>> memory banks when surrounding memoryblocks are released. Can someone

> longer = start(7) and the variable must be reset by the programmer,

OK, how do you know when that moment arrived? Just by keeping track on which banks are used and when a bank get released?
And that was the point I tried to make. If the displayed screen is located in that bank you the shifter could display the wrong memory area but it looks like STOS can keep track of the memory adresses because you are telling STOS what adress should be used. (I wasn't so honest to Omikron).

> allways go to the logic, a good programmer will allways set logic to
> = back, so work is hidden, then a screenswap command will swap the

Hmnm, I am a bad programmer then. Most parts of my demo use only on screen. I simply make sure I update a part of the screen after is was displayed by the shifter.

> logic,physic, = instant graphics as no data is moved, only a pointer
> changed, I cannot see anything being faster? logic can be set to

> anywhere, back, physic a bank, anywhere......

You can't see anything being faster because you don't know what happens after you told STOS you want to switchthe pointer. The data displayed won't change until the shifter has been told the screen is at an other adres. And how do you tell the shifter which adress is the screen adres?

By:

```
poke $ff8201,(screenadres shr 16)
poke $ff8203,(screenadres shr 8)
```

All other commands will eventually write to those hardware registers.

>> I guess there are a lot of extensions you can use for a lot of
>> different things. So it's resonable to think there is more than one
>> extension that supplies you with a command to set a block of memory to
>> a cetain value. Maybe

> All the memory allocations are done with STOS original commands,
> well in my work, I cant speak for all STOS programmers:), but I do
> not recall any commands in any extension for allocating memory, unless
> the termonolgy is confusing me:)

Yes it is I think. By setting memory I mean setting the bytes (words etc.) in a memory block ro a certain value. So the question

>> there are commands that lets you set memoryblocks with a 2, 4, 8 or 16
>> byte

means: are there different commands that let you set the bytes in a given memory block to a given value? And are there other commands that allow you to set a block 2, 4, 8 or 16 bytes into a certain value?

> extensions are obviously not made in STOS, so i cannot help you
> there, I know a certain amount, but it could be the blind leading the
> blind, making extensions is well out of my luegue i am afraid,

Ok, but how do you use extensions? I think there is something like a library with a lot of functions. I asume you can use multiple libraries at the same time in a program (one for the sound, an other for sprites and maybe again an other for doing heavy duty memory moves). What happens if two functions in different libraries have the same name?

> My apologies, I found it difficult to seperate the two threads, ie
> STOS and this one, SORRY :)

I can understand that. I would kill someone who attacks me too! (First shoot, then ask 'Wa d'ya want?'. That's the safest way.)

> STOS returns error 8, out of memory....
> But STOS has amongst its nifty commands and preset variables, free,
> so print free return the available memory, you can allocate a bank

Just like all other basics I know of. It will give trouble on multi tasking systems. Because in the time you determine the amount of free memory and the moment you try to allocate it, an other application might grap a huge block of memory, leaving your program no other option than to generate a error. But lucky us, multitasking is of no importance here.

> with "reserve as data 7,free" although free-1280 or simmilar might be
> a better idea:)

Still wouldn't be a great way of programming. Can you determine the size of a reserved memory block after it has been reserved. Like in your example, can you determine the size of bank 7?

Bye, Hans Wessels

> to be able to keep the game at the speed it is?,

I don't know. On a plain 1040ST (1Mb) there are about eight scanlines left before the start of the VBL. Don't know how much time is needed on a STe nor the amount of time needed to display the sprite. You are the only one that can find out by placing rasters around the routine that displays the main character. If you say there is not enough time left I won't argue about that.

Bye, Hans Wessels

BTW: I can't get to the last eleven coins. Eight of them are located very high, left from the middle on the lower half of the map. The other three are located on the first level above ground level where the longest slide of the game ends (It's also on the upper half of the map.). Can you give me a hint how to get there? And will those eleven coins give me enhough points to break the 3k limit? (Now I have 2620 points, only the eleven coins and the ace card to go.)

Most of them are simulation games and don't compare to the Arcade games Tony makes. The number of Arcade games running with speeder boards is less. Most DMA loaders won't work. Using the hacked version of the game solves that problem. Jeff Minter games work on speedy Atari's and that are real arcade games, but I guess Jeff doesn't use basic. :-)

>> Can a Programming Language be the best of all, if the resulting

>
> YES, when there is nothing better about?, a game made in BASIC that
> works on most ATARIs is better than a none existant game, how many
> ATARIs will that work on, no game=no ATARI's...yes?

Ok Tony, let me see... We have the following C games:
Kubis '96, WinColTris and Nethack running under GEM. (I think the most GEM games are written in C, but I haven't tested them so I can't prove it to you.)
GNU chess working character based.

All those games work on all Ataris, under all resolutions, maybe some of those games require you to have a harddisk (I usually don't test a game from floppy disk if I can run it from harddisk).

If you want to have more GEM games, maybe even written in Gfa (or another basic), just plunder a German Atari ftp site.

So either we can remove C from the challenge list, or we have to concentrate on arcade games running in ST LOW. The best way is to remove C from the challenge list, because then most of the original statement is still true. But the moment a basic GEM game is found your statement collapses again. So maybe it safer to concentrate on arcade games running in ST LOW.

So what's it gonna be? (Wow, dirty question, answering it means you agree you starting statement was false!)

>> So tell me how do you would switch resolution from:
>>
>> - ST low with AS OverScan (368x264x16) to ST low (320x200x16)

Hey Uwe, what AS Overscan driver are you using? Mine does only (400x240x16) in ST low. How do you get the 24 extra scanlines? (My settings are (400x240x16) in ST LOW, (816x240x4) in ST medium and (720x480x2) in ST HIGH (I have got a SM144 monitor for high res, they are faster with the horizontal retrace).

>

Are we allowing C or not? The original statement included C.

: >10000-line *structured*, easy-to-read source in STOS! Let's face it,
: >the programming-language itself is crap. No procedures, no functions
Speaking as someone who is working on a project with 27 classes all in MSDev Studio I would say that there is not much diffence over structure Vs Basic style. What is important is you get to know the code, make sure it is neat and comment it. Your textbook folk will say procs etc are so wonderful but practically there is little difference! BTW gosubs can be given labels in STOS e.g. X=500:Gosub X

: Thats a matter of opinion, there are a lot of people using it, surely
: that tells us something?
Yep. We still see more STOS stuff than anything else.

: >and no dynamic datastructures (No datastructures at all except for
Not that useful in games programming but would be nice I suppose.
Always memory on disk so using files you could do what you like so not a total limitation.

: >Perhaps you should try looking outside the (very) small world of BASIC
Visual BASIC is very very popular on a platform that has something as structured and powerful as VC++??

: For what ?, why would I want to when BASIC is doing everything I
: personally ask of it ?
Exactly. Instead of time spent on learning GEM you can use what is already available to you. STOS wimp features are really easy to use and are amongst the best I have used including 32bit windows!!

: make a serious application that needs GEM you see <duck!>
Sigh and we were hoping for a decent GEM game... :-)

: >use to maintain large sources with line numbers, goto's and gosub's.
Nope this is rubbish. Get a printout, a notepad and a ballpoint pen and it is fine! You don't have to use goto at all. That is to do with good style - not the language itself.

: The original statement was to, start a thread in an otherwise empty
: and boring newsgroup :), have a healthy debate with other BASIC coders
Uk.comp.misc was more exciting than this place until a wee while ago! <wink>

: >additional library, just like your extensions. They're not a part of
: >the language, and no sane person would say that the language BASIC is
: >more powerful than C??
Visual Basic is more powerful than my C compiler! No easy database support.. No easy GUI...

agape,
Davy

I have an idea for a program it would need to run in GEM (So not a
game), I haven't seen it sone on the ATARI yet, Its a simple enoug
program and will be usefull to onliners :)
I tried personal Pascal from the ST Format cover disk, I was suprised
that I could actually follow the Routines given away with it (to a
certain extent) and even Compiled a bit of an ACC, albeit a hacked up
one from there source, but it wet my appetite enough:), when I say I
ordered it, I am simply getting a replacement copy of the coverdisk
version I have since lost, I am too poor to actually buy new software

3834. PPAS: Underlining characters in buttons?

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-29 00:00:00 UTC
From: erik@schunta.etc.tu-bs.de
Message-ID: <57meul$mkk@ra.ibr.cs.tu-bs.de>
Source record: 8426

Hello wizards out there,

I'm busy writing an app in Pure Pascal that features dialog boxes in AES windows. It works, but what I couldn't figure out yet is how to underline a char in, say, an exit button, radio button or such. This is, as you know, used to indicate which key to press with the Alternate key to select the button via keyboard.

Now, everyone does this. How's it done? Do I need to transform the buttons to G_USERDEF objects, or G_FBOXTEXT objects? Or do you just put the lines in there with appropriate VDI calls? With a week of trying, I might end up with something that works, and I'm not looking for ready source code here, just hints in the general direction would be appreciated -- I don't plan on writing something that sort of works, but in a different way than the way it should.

Please do reply via email, because I don't yet have access to Usenet on a regular basis. If there is sufficient interest, I'll post a HOWTO here when I've arrived at a solution. This goes for all problems with window dialogs... if anyone out there has a related question, feel free to mail me. Who knows? I might even be able to help you.

And please *don't* ask why I don't want to use anyone's library to do this... it's an altogether different and potentially lengthy discussion in there, as is in why do I use Pascal. :-)

Oh, BTW, what's this Personal Pascal thing about? Am I missing something dramatic here?

Thank you for your time.
Yours, Erik.

>Jeff Minter games work on speedy Atari's and that are real arcade games, but I
>guess Jeff doesn't use basic. :-)

What are you talking about? Jeff's games DO NOT work on fast Atari's without
changing from the standard setup. The reason for this is that Jeff uses self
modifying code in his sample replay code. This causes a crash on any machine
with a data cache that is operational (ie. Falcon, TT, and probably Hades etc.)
Yes, disabling the cache improves compatability.

(note that his STE/TT versions dont play sound on Falcon's either - for the
same reason that Heartland doesn't - Atari redefined the lowest speed to be
sample off)

- all this is based on Llamatron, Revenge, Revenge STE and Hardcore demo.
Obviously Llamazap only works on Falcons, Trip-a-tron (not a game, but hey)
has problems on an STE - and doesn't do any better on a Falcon. 'Thingy'
(I believe an early version of colourspace ST) DOES work, although it doesn't
correctly change mode at the beginning, so you have to start in ST-Low.
I cannot remember what colourspace did (I think it worked from ST low)

>Ok Tony, let me see... We have the following C games:
>Kubis '96, WinColTris and Nethack running under GEM. (I think the most GEM

>us, multitasking is of no importance here.

Well, nothing would happen anyway - as STOS allocates all the RAM it can at
the begining, and when a STOS program 'frees' memory it doesn't actually
free it back to the system - just the STOS memory manager.

Also, as already pointed out, STOS runs in supervisor mode, so there is no
chance that another task can grab some memory... :)

>reserved memory block after it has been reserved. Like in your example, can you
>determine the size of bank 7?

yep length(7) gives this.

>Kubis '96, WinColTris and Nethack running under GEM. (I think the most GEM
>games are written in C, but I haven't tested them so I can't prove it to you.)

So you also cannot tell me wether they are any good? and until you can, then My statement stands, I am not for one moment suggesting they are not good, I have not seen them, but for them to have ANY relevence to this thread then they must be good games made in BASIC or C (with no added mc) and have been made in 1996

>All those games work on all Ataris, under all resolutions, maybe some of those
>games require you to have a harddisk (I usually don't test a game from floppy
>disk if I can run it from harddisk).

if they require a hd then they are definatly not a reccomended good game, MOST atarians do not own hard drives,

>If you want to have more GEM games, maybe even written in Gfa (or another
>basic), just plunder a German Atari ftp site.

But are they made in 1996 and how would we know if they are simple BASIC shells calling lots of m/c?

>So either we can remove C from the challenge list, or we have to

Certainly not!

>concentrate on arcade games running in ST LOW. The best way is to remove C from

No, you have said nothing to convince me, and more importantly you have shown me nothing to convince me,

>the challenge list, because then most of the original statement is still true.
>But the moment a basic GEM game is found your statement collapses again. So

No, then we decide which is best, but you havent even found a good game written in 1996 BASCIC or C yet!

>maybe it safer to concentrate on arcade games running in ST LOW.

NO, My statement stands until you or someone else shows me something
made in BASIC or C in 96 that is better than a STOS made game, you are
very good at talking, but no one can play that ?

>So what's it gonna be? (Wow, dirty question, answering it means you agree you
>starting statement was false!)

Yeagh?...see above, this is not Chess, I cannot be cornered or pushed
into a false move,
You see I will be quite happy to say ok, x language is better for
making games in this day and age, if you show me something, but with
the best will in the world i can not say that now just because you say
its possible, SHOW ME!

> > But also have the ability to use ATARI ST low, so ????
>
>Autoswitch Overscan has, but go to a VGA type card and you say good bye to the
>good old ST resolutions.

AW Give us a break, you have to draw the line somewhere,

Q when is an ATARI not an ATARI
A when it cannot even handle standard ATARI screen resolutions

Having these extra screen resolutions is great, I saw some in action
at the recent English ATARI shows and I was gobsmacked, with a mega
STe (owned by Harry Sideras A.A.U.G.) looking a lot better than any of
the falcons on show, it had far better screen display etc,
BUT If a machine does not even have the capabilities to run a
standard ATARI resolution then is it realy an ATARI in the true spirit
of the thread, if so, then where do you draw the line, or will we next
be told that STOS is sad because it wont work on an ATARI Jaguar, or
maybe an ATARI 800XL Computer,
All this talk of Hades and Madusa etc, it really is taking things a
little too far dont you think,

How many Hades Computers have been sold
How many of these people will want a game made on a ST

There aint going to be enough to even warrant booting STOS, get real
please :)

> > may not be the best all round BASIC for the ATARI and my games may
> > not be the best in town, until you show me better, written in BASIC

>around in my progs... I haven't examined its behaviour in too much detail
>because I dont tend to do things like erase/reserve banks appart from in
>the initialisation stages...

This is what I am trying to get accross, I don't know if its simply
habit, but I usually set up all my banks, arrays etc, have everything
I am going to need later, all ready before the game starts, a little
like a Chef would lay out his ingrediants and utensils, I would not
want to trye erasing or allocating banks in the middle of a game loop,

However I have found it to be true that setting a variable as the
start of a bank then erasing reserving other banks can cause an
address error, I usually have my variable = bank commands right at the
end of the setup, best just before the main program loop starts, that
way you know they will all point to the correct place,

>STOS generates an error (suprisingly 'Out of Memory'). This can be caught
>by your program using the 'on error goto' command, which may handle the
>error in anyway it considers fit, and then if possible 'resume'.

If I know this is a possibility in the program then I first reserve a
small bank of memory, as soon as my program detects an error 8 (out of
memory) it erases the bank, thus freeing enough memory to draw
..maybe a nice alert box etc and an involved error routine, such as a
mini menu featuring, try again, go back to? , quit, cold boot, warm
boot etc,
This should only be neccasay in a program that allows user input of
some sort, ?

Cheers.............!ynoT

Hey what about PC MART...And everyone get PC MART, next issue I think?, they are printing an article about ATARI, by eeeeerrm ? and I don't mention STOS in it :))), its either next, or the one after crimbo:)

As to your suggestions, this is exactly what we are going to do with diamond-ice, no pdls, just available through me by email, or snail to my artist partner, each copy will have the name of the owner on the play screen,
This is to keep track of how many people are interested in our software?
We will advertiose the game through all known user groups, diskmagazines, free paper magazines and hopefully get soemthing reviewed in Atari Computing,
The game will be FREE, but we simply want to keep track to see wether its all worth while,

Cheers.............!ynoT

>like that language though.

I purchased Pascal & C at the same time. I could already program
Pascal well and knew nothing whatsoever about C. Even with this bias,
it did not take me long to decide C was the better long term prospect.
Had modula 2 been available at the time, things might have been
different. Fortunately it wasn't - I would have regretted never
learning C.

Better clarify libraries here as both sides are in danger of getting themselves into a corner :-)

A compiler library (this is not C specific) most usually consists of pre-compiled source code. When the main program makes reference to a particular command then it is noted. Once everything is compiled, the linker has the job of going through all these "unknown" commands and attempts to find those commands in the libraries you have told it to use. If it finds them all you get an executable program otherwise you get an error.

To add new STOS commands you need an extention. To add new compiler commands you need a library. In effect they are the same thing. STOS is to be praised for providing the facility at all, especially when you consider how long ago it was since it first came out.

The power of a library is you can choose what to put in it (or take out / replace) yourself. If I find I have written the same routine more than a few times, I tend to generalise it and add it into one of my libraries. I never have to write it (or compile it) again. Same thing with STOS - may be hard for the user to do but it is possible thus both are the same!

> > saves me having to add perameters to the music play command,
> > This is the same for fonts used in windows, sprites etc,

>So memory banks are very thight coupled with the command set. How does this
>affect new or improved commands?

One of the reasons the new commands are faster is that a lot of the control is taken away from STOS, you have to use variables to keep track of the start of banks for just about all the new commands

>Example: I want to use a Digmax tune or a Countzero tune, these music types
>have to be initialized and played in a different way (if I remeber it correct,
>there are a lot of different chip music formats.)

hehehehe, variable=musauto(start(?),tune_number,length(?))
that command recognises most (about 20+ i think) formas of chip music

>Same thing for a sprite routine. How is a bank matched to the right sprite
>routine?

ok the new sprite commands=BOBS or one bitplane JOEYS
BOB DESTINATION_SCREEN,BOB_DATA,IMG,X,Y,etc

if i use start(7) as bob data then stos will always know the bobs are there, its a compltete replacement to stos sprites so stos doesent care whats in there, but as a variable is faster then I would use a variable and re assign if any memory is allocated while the routine is running, but that never happens,

>> > hmmm I can only presume its easier for STOS? Dunno realy, having
> > never used other programming languages to the extent of memory
> > allocation, then I never questioned the way STOS does it?,

>Seems so. Creating a lot of trouble to understand each other.

Thats due to the major differences in the programming languages, I have never heard of "memloc" before ? for instance :)

> > Then at some point another bank is erased or made? then S7 will no
> > longer = start(7) and the variable must be reset by the programmer,
>
>OK, how do you know when that moment arrived? Just by keeping track on which
>banks are used and when a bank get released?

Yep, but to be honest I never do any memory bank erasing allocating
while a program loop is running, all that is as I tried to explain,
done in the setup routines ?

>And that was the point I tried to make. If the displayed screen is located in
>that bank you the shifter could display the wrong memory area but it looks like

No because dont shift memory while the game is being played, ie
while the main loop is running,

> > allways go to the logic, a good programmer will allways set logic to
> > = back, so work is hidden, then a screenswap command will swap the

>Hmnm, I am a bad programmer then. Most parts of my demo use only on screen. I

Ho dont be silly, I meant a good STOS programmer, sheesh! :)) we have
a differnet screen set up, we dont use GEM, remember? so are not
restricted to the GEM way of doing things, whatever that is?,

>until the shifter has been told the screen is at an other adres. And how do you
>tell the shifter which adress is the screen adres?

STOS Allways knows where Physic, Logic and Back are, so a screenswap
command will swap the pointers between physic and Logic, physic,logic
and back are all preset variables, so PRINT PHYSIC will return the
adress of the physical screen, same with logic and back :) ?

>poke $ff8201,(screenadres shr 16)
>poke $ff8203,(screenadres shr 8)

>All other commands will eventually write to those hardware registers.

ho look! more pokes.....hmmmmmm

> > not recall any commands in any extension for allocating memory, unless
> > the termonolgy is confusing me:)

>means: are there different commands that let you set the bytes in a given
>memory block to a given value? And are there other commands that allow you to
>set a block 2, 4, 8 or 16 bytes into a certain value?

sorry, but you are still totally confusing me here? I have no idea
what you are talking about? honest!

> > blind, making extensions is well out of my luegue i am afraid,

>Ok, but how do you use extensions? I think there is something like a library
>with a lot of functions. I asume you can use multiple libraries at the same time

Yep but everything has a limit, extensions is 26, and each extension
will only allow x amount of commands, soory no idea what x is?

>in a program (one for the sound, an other for sprites and maybe again an other
>for doing heavy duty memory moves). What happens if two functions in different
>libraries have the same name?

then you have a crash!......however extension makers will find out
what other extensions are available and try to work around it, hence
some very funny sounding commands :)

> > so print free return the available memory, you can allocate a bank

>Just like all other basics I know of. It will give trouble on multi tasking

Well I havent tried all other BASIC so I would not know?

>memory, leaving your program no other option than to generate a error. But lucky
>us, multitasking is of no importance here.

Yawn.....ZZZZzzzzzzz.............

> > with "reserve as data 7,free" although free-1280 or simmilar might be
> > a better idea:)

>reserved memory block after it has been reserved. Like in your example, can you
>determine the size of bank 7?

You mean like
print length(7) or x=length(7)

So why would it not be a great way of programming?, so long as all
this is done outside of the game loop, then whats the problem, and why
do any memory setting from within the game loop, surely that IS bad
programming ? :)

Cheers.............!ynoT

> any other adres register. (I frequently do so.)

True. The code which I posted will fail when USP==SSP. (For example,
inside a Supexec()'d function, a Super() block within a function)

I found this out the hard way, when I started to re-implement some of my
extensions so that they could make Toolbox calls from supervisor mode.

I fixed it by copying the params from higher up the SSP onto the lower
SSP, and then pointing the USP at that.

> You can't use the user stack as stack anymore, because pushing things on the
> stack will distroy your stackframe making a rte a call to nirvana.

Thanks for mentioning that. (in my defence, I typed that code directly
into my newsreader (tin, running on my ISP), I didn't want to have to load
4-5000 lines of source and then eradicate all bar perhaps 20

I still feel uneasy about copying a fixed-size block of param data from
the stack, though.

(My API has all data on the stack - GEMDOS/BIOS/XBIOS-like).

Perhaps I should implement a new version 2 API which uses a pointer to a
parameter block? This would break the simple-to-implement and
fast-to-access-parameters ability of the code.

3852. Devpac 3.1 bug? (Multiple REPTs in a MACRO)

Newsgroup: comp.sys.atari.programmer
Date: 1996-11-30 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <b1e7cc$17a4.110@HERMES>
Source record: 8295

I've come across a bug in Devpac 3.1 whereby having more than one REPT loop in a MACRO will cause it to fail with a "can not nest REPT loops" error.

The code calling it is not within a REPT loop, either.

To create the macro, I simply lifted a working piece of code (used in three different places in the app), and block copied it to the start of the source file, and wrapped a macro definition around it.

(The code is used in three different parts of the prog, and for speed I would like to keep it as an inline piece of code, rather than a subroutine call - which I would normally do were it not for this). Also, making it a macro means that I can define it once in one place and not have to block copy it multiple times - possibly missing one.

The "offending" macro code looks something like this:

```
Foo MACRO

; some code goes here...

; copy text block as longwords
a set 0
REPT XSIZE/4
move.l xl_1+a(\1),le_1+a(\2)
a set a+4
ENDR

; more code goes here...

; copy info block by longwords
a set 0
REPT YSIZE/4
move.l xl_2+a(\1),le_2+a(\2)
a set a+4
ENDR

; and yet more code goes here...

ENDM
```

And then in the source, I call it with the line

```
Foo a3,a4
```

so that \1 will be replaced with a3, and \2 will be replaced with a4

But, instead, once it hits the second (un-nested) REPT it gives me that error message.

Neither the manual (for v3) or the v3.1 addendum mention this.

REPT loops on page 99 says nothing, and MACRO operations on pages 110-117 say less than that with regards to this problem.

Ho good, someone who knows all about STOS extensions and all about C libraries, good :)

>A compiler library (this is not C specific) most usually consists of

snippooooooooooooos

So a C library is a collection of subroutines that can be sort of "called" and compiled into your program, a selection of subroutines written by the C users , in C for a C program? the sole purpose of which is to act as a subroutine that you dont have to keep writing yourself,

And STOS Extensions are the same you say ?

hmmmmmmmmm thats spooky, because from where I am sat they are a million miles apart......how do you compute they are the same ?

A STOS BASIC programmer like myself, cannot write an extension?
A STOS extension is an upgrade to the programming language that either replaces existing BASIC commands with new faster ones, or adds new BASIC commands to the language,

From my point of view as a purely a BASIC programmer, Your C libraries are a collection of subroutines written for convenience so you dont have to keep writing them yourself, but STOS extensions are new commands that a STOS user could never write himself,

How do you conclude that they are both the same?

If I get together a whole bunch of my most used sub routines, place them in a folder called "Library" and then rewrite my compiler to include these subroutines when the code it is compiling points to one of them, then is that the same as a C library???, because it sure as hell aint the same as a STOS extension,????

What do you use to develp programs uner MagiC and then debug within the multitasking environment ? Ok, you can compile C programs with Lattice or Pure C as a task, but the debugging procedure is much more tricky.... can it still be done, or is it necessary to switch to monotask ?

You can with Fforce, however writing your own routine would be much more
powerful. Knowing that however it gets there almost all text output is going
to go via Cconws and Cconout - simply write a TSR to intercept these calls
and take it from there.

If you alter your statement to read: STOS is the *easiest* BASIC to produce a game in. Then I agree with you entirely but *best* no I'm sorry can't agree there bud, it simply doesn't give you enough system control.

The reason no-one can come up with a good game written in another basic this year is because there aren't any (probably!), doesn't mean to say that if someone had the desire to there couldn't be. Have you seen some of the pre-1996 games written in GFA?

HA!

I just found a game that will match your race!

ftp.cs.tu-berlin.de/pub/atari/Games/Yukon/*

Yukon is a patience clone.
- last version from 16. Aug. 1996
- with sound (DMA sound if available),
- classic soundset
- startrek soundset
- [...]
- GEM GUI,
- 2/4/16/256 colors
- 640x200x4, 640x400x2, 800x600, ... [whatever you have]
if you have cards for 640x400x2 so they can also be used for any other
resolution with the same color depth and at least (in this case) 640x400
pixels.

(if you need cards for 320x200x16, just create your own, a tool is included)
- runs also with multitasking OS like MultiTOS, MagiC, MagiCMac.

Now it's your turn.

>I will put STOS games on a head to head with any others, and win...

Show me a STOS patience game that covers all this features.
31 days left...

>>>>Just seen yesterday. The only difference is speed. A PowerMac 8500 or a

Since July 1995.
(The date of the first official release of MagiC for PowerMac.)

>...and dont you draw the
>line anywhere? how about a jaguar, thats atari,

If I speak about atari computers I mean ATARI TOS compatible computer
platforms and ATARI OS compatible OS. (Original atari hardware, clones,
emulators, MultiTOS, Geneva, MagiC, MagiC PC, MagiCMac, MagiCPowerMac...)

The ATARI 8-bit series, the Lynx, Jaguar, Portfolio and ATARI PCs are
excluded.

When going for GEM applications I think you have to go for C. Most literature about the OS and GEM programming is also written with C in mind. Even the whole OS was originally written in C. Pascal can give problems on some points because C strings (as used in the OS) and Pascal strings are fundamentally different.

> ordered it, I am simply getting a replacement copy of the coverdisk
> version I have since lost, I am too poor to actually buy new software

There are two good PD C compilers available. The first is GNU C, the second is Sozobon C. The GNU C environment is quite hard for beginners I think and it does definitly need an harddisk. You have a chance Sozobon C (or is it Sosobon C?) still works on floppy based systems.

> yourself,

No, C libraries are more. The command set of C is very limited. The C language it self has only 32 reserved words (that are words you can't use yourself as name of a variable or function):
(auto, break, case, char, const, continue, default, do, double, else, enum, extern, float, for, goto, if, int, long, register, return, short, signed, sizeof, static, struct, switch, typedef, union, unsigned, void, volatile, while)

So there are no print commands, no load or save commands, no memory allocation commands. All that cind of things are done with library functions (C has only functions, no procedures. What pascal calls a procedure is in C simple a function without a result).

There are sets of functions that come with every C compiler. That are the standard libraries. What should be available in the standard libraries is defined in the ANSI C standard. C libraries can be written in C, but also in an other language or assembly. As C programmer you have the possibility to create your own libraries with much used functions.

> And STOS Extensions are the same you say ?
>
> hmmmmmmmmmm thats spooky, because from where I am sat they are a

>
> A STOS BASIC programmer like myself, cannot write an extension?
> A STOS extension is an upgrade to the programming language that
> either replaces existing BASIC commands with new faster ones, or adds
> new BASIC commands to the language,

So STOS is less powerfull as C because you can't write our own extensions. So a STOS programmer is in the same position of a C programmer that doesn't know how to compile a library. From their point of view an extension (library) is a new set of statements (functions) they can use.

> From my point of view as a purely a BASIC programmer, Your C
> libraries are a collection of subroutines written for convenience so
> you dont have to keep writing them yourself, but STOS extensions are

The whole concept of STOS extensions is covered by C libraries. Only C libraries are a bit more flexible.

> If I get together a whole bunch of my most used sub routines, place
> them in a folder called "Library" and then rewrite my compiler to
> include these subroutines when the code it is compiling points to one
> of them, then is that the same as a C library???, because it sure as
> hell aint the same as a STOS extension,????

No, a library is a set of already compiled code, just like an extension. You have to tell the compiler which libraries you want to use in your program. But yes, I think libraries are basicly the same as STOS extensions.

Why made in 1996? A game made in basic in 1987 is still posible to be done in 1996.

>> All those games work on all Ataris, under all resolutions, maybe some

>
> There aint going to be enough to even warrant booting STOS, get real
> please :)

I am real (I think). You have to get real. If you say something about a best language to program games for the Atari you have to face its implications. That includes IMHO Hades and Medusa computers. I had problems on that point my self. Cache memory in 68040+ processors a a lot biger as in the 68030, giving trouble with slef modifying code.

>> Are we allowing C or not? The original statement included C.
>
> Yes we are allowing C, my original statement seems to gain strength

> with every posting you make :)

So Kubis '96 ends the trouble. It's written in C, is a game and runs on every Atari in any resolution.

If you are looking for a debugger go for bugaboo, it comes with the Turbo assembler package. The current version in 1.77. It is shareware, but there are no limitations to the use of the programs. I have been told Sigma soft doesn't support it's products anymore (the two most improtant products of Sigma soft are Midimaze II and Turbo Assembler).

The great thing with bugaboo is you can run bugaboo in ST HIGH and the software you are debugging (games, demo's) in ST LOW. With a monitor switch box you can connect both monitors at the same time to you
computer.

Yes I did. (I have to be carefull with that function because leavin and
entering the game too much will lock up the game (all turns black). I can't
reproduce this on a plain 1040ST with 1 Mb.)
I don't see a possibility to get to those coins on the map. That's why I am
asking you for a hint.

>> there? And will those eleven coins give me enhough points to break the

Well it's definitly the ace (locate at the left side of the map). As soon as I
pick up that card the game ends.

> Use the MAP VIEW for the coins.....comments please ?

I did. The original question is still standing. I need help.

>game in. Then I agree with you entirely but *best* no I'm sorry can't agree

Hmmm I had a long think about this one, yes I agree with you, from
what I have seen of other BASICs then I would have to agree STOS does
seem to be the easiest, this does help my statement, ie: its the best
to use :)

>there bud, it simply doesn't give you enough system control.

Have you seen anything made recently in STOS ?, to be exact a game? I
can show you a dammned fine game that does not lack anything because
of lack of system control??, therefore your point although true in the
fact that STOS lacks greatly in that department :), would seem to hold
absoloutly no bearing in this debate ?, hehehehe

>The reason no-one can come up with a good game written in another basic this
>year is because there aren't any (probably!), doesn't mean to say that if
>someone had the desire to there couldn't be. Have you seen some of the
>pre-1996 games written in GFA?

hahahaha yeagh, and nothing GOOD?, but the thread is 1996, the thread
is not, lets all move the goalposts and add more bits to try and win
the debate, sorry but pre-1996 does not count, STOS was not as
upgraded in 1996 as it is now, so hardly fair to change the rules, one
of my points is that STOS has been upgraded you see ,

I have Hisoft BASIC, GFA BASIC 3.5, FirST BASIC and STOS BASIC, from
what I can see, if I or anyone else wants to make a game, then STOS
wins hands down, why would I want to use GFA to make a game when STOS
is there offering a hell of a lot more, and as you rightly say is
easier?, because it has GEM support? phoooey, thats what would cripple
a good game not be an advantage,
If I wanted to make ANYTHING other than a damm good game, then I
would probably opt for GFA BASIC, I am not saying STOS is the best
BASIC, merely the BEST for making games at this point in time ? :), I

am willing to put software forward to prove this point, and that is
exactly what no one else is doing, thus proving my point,

Cheers.............!ynoT

Abusing a language on the strength of one compiler, which you yourself admit is poor, is not desperately sound reasoning IMO. Ada has it's faults, but your argument is no more valid than if I were to abuse C on the strength of the nasty experiences I've had with BorlandC++ (version 3 or so). Try GNAT under a real OS sometime.

>which is to act as a subroutine that you dont have to keep writing
>yourself,

Sort of. The important point here is that at the time a command from
the library is referenced in the program the command does not exist
and the compiler does nothing about it apart from recognising the fact
that the command exists. After the compiler has finished it executes
the linker whose job is to locate the command and add it into the
program. The command exists as object code _not_ source code. If I
knew all the details required (linker format and register usage), I
could add a command to your Pascal compiler written entirely in C and
the reverse is possible as well.

> And STOS Extensions are the same you say ?

I can't see any reason why STOS extentions could not be written in C,
pascal or any compiled language. It's simply an adaptation of the
above.

> hmmmmmmmmmm thats spooky, because from where I am sat they are a
>million miles apart......how do you compute they are the same ?

Same reason as above.

> A STOS BASIC programmer like myself, cannot write an extension?

Why not? All that's needed is the info on how to add a command and a command to add.

> A STOS extension is an upgrade to the programming language that
>either replaces existing BASIC commands with new faster ones, or adds
>new BASIC commands to the language,

Same with a library. Remove all your pascal libraries and try compiling something - it won't get far!

> From my point of view as a purely a BASIC programmer, Your C
>libraries are a collection of subroutines written for convenience so
>you dont have to keep writing them yourself, but STOS extensions are

>of them, then is that the same as a C library???, because it sure as
>hell aint the same as a STOS extension,????

Does the STOS compiler insist on using the source for libraries?

The following bit of code would make a copy of the screen in memory it calculated and allocated automatically ...

```
main()
{VIMG v;
Rect rr;

appl_init();
v.vi_vwk = V_Opnvwk(true);
wind_get(WH_DESKTOP,WF_CURRXYWH,PRECT(rr));
Img_Grab(&v,rr);
V_Clsvwk(v.vi_vwk);
appl_exit();
exit(0);
}
```

appl_init(), wind_get(), appl_exit() exist in a library called libaes.a.

exit() exists in library. libc.a

V_Opnvwk() and Img_Grab() are written by me. They exist in a library I created called libg.a

The compiler can build an executable program without the source code for _any_ of the above functions. The only source code it needs is the above. So I still maintain that STOS extentions and object libaries

are identical in terms of use. ;-)

stosser@airtime.co.uk (Tony Greenwood) said:-

> hmmm I would seem to agree with this, but how many C programmers dont
>know how to compile there own code?

You'd be surprised. Even more surprising is you never have to if you
dont want to. To see why, you'll have to wade through the following
waffle ...

Most people will probably never make their own libaries but I know of
no C compiler that does not posess the tools to do it if you want.

When you first get into C, you tend to write one big program. This
soon expands into one big program which is divided up into functions.
Many people go no further than this because they don't know that you
can, don't need to, or think the next bit is too scary! ;-)

Of those that do, the next stage is to split up the program into
separate files. You tend to group functions together according to a
certain purpose which makes the management of large projects much
easier - and you write a special text file called a makefile. In this
you tell the compiler which files depend on which others. When you
compile, the "make" program only runs the compiler on those files
which _need_ compiling. On the first ever "make", everything has to be
compiled but thereafter only those files which have been altered, or
depend on ones which have been altered, are ever recompiled. Thus,
this drastically reduces the time taken to recompile (ie debug) large
programs.

When compilation is finished, the linker examines all these compiled
files (object files) and tries to put them all together into one file
which will be the program (executable). It does this using a symbol
table attached to each object file by the compiler. The symbol table
contains the names of all the functions and variables which are used
in that object file. It looks through them all and starts building the
executable file by merging the object files into the executable file,
one by one. There is enough information in the symbol table for the
linker to ensure that where a function in one file calls a function in
another file, that the function will indeed be called (no flames about
scope please - this is complex enough!).

Having done this it is well on the way to having an executable file.
There's just one more bit. If the symbol table contains any functions
or variables which are still undefined then this is where the
libraries we have been discussing come into play. It will scan the

ones you have told it to use, looking for the undefined stuff, adding it into the executable as it comes across them.

Anyway, most people writing large projects have no need to add their object files into a library (performed simply by using a tool to add the object files). All a C compiler does is go through the stages described above with the sole purpose of finding "undefined stuff". If anything is undefined at the end it comes up with an error (usually). It will come up with an error if it finds two different things with the same name (usually).

Hmm, that was hard to write. Even authors of only half decent C books have just gone up a few points in my estimation! :-|

That small list enables you to do just about anything. You can do
loops and make decisions just like any other language. The powerful
bit is being able to make your own language up (within the syntax
rules of C).

A simple ...

typedef signed short Wibble;

.. at the beginning of each program allows you to spend the rest of
your C programming days declaring 16 bit values by the name "Wibble" -
it is now part of the language! ;-)

More powerfully ...

typedef struct {
char forename[20];
char surname[40];
Wibble age;
} BOD_INFO;

.. makes declaration which allows you to group your data together in
a nice logical way. C now knows another name, "BOD_INFO" and it also
understands that it is quite complex ...

main()
{BOD_INFO bo[2];

```
bo[1] = bo[0];
}
```

.. is something similar to (not done basic for years) <G> ...

```
main()
{/* BOD_INFO - sort of, cant do it exactly the same */
DIM forename$[2][20];
DIM surname$[2][40];
DIM age%[2];

/* bo[1] = bo[0] */
forename$[1] = forename$[0]
surname$[1] = surname$[0]
age%[1] = age%[0]
}
```

.. C can do a *lot* of work with very few statements.

> I would hate this to get into a debate, as I dont fancy getting even

: the debate, sorry but pre-1996 does not count, STOS was not as
: upgraded in 1996 as it is now, so hardly fair to change the rules, one
: of my points is that STOS has been upgraded you see ,

This is silly! Are you saying that just because a game is written before 1996 it's unfair to compare it with "STOS 96"? If age is an issue here it should be the other way around! Or are you afraid that somebody wrote a better game in BASIC already in 1989... ;-)

: is there offering a hell of a lot more, and as you rightly say is
: easier?, because it has GEM support? phoooey, thats what would cripple
: a good game not be an advantage,

Agree. Most GEM-based games stinks. It isn't possible to write a good arcade-game that's 100% GEM-based. Why is GEM even mentioned in this thread at all? Yes, I know that STOS doesn't support GEM (And the BIOS/XBIOS-support stinks too.) but it really isn't relevant here. Compatibility is a lousy argument, GEM-based games are too slow to run on simple 68000 Ataris. And without a 3D AES and atleast 16 colours they are ugly as hell too.

: limiting?, from that description?

No, that exactly what it's not! Because of the very limited amount of
reserved words and the standard libraries, C-programs can be compiled on
just about any platform ever made.

: so <?> eeerm wheres the flair? wheres the programming, is it just a
: shell calling all these libraries?, why does it sound so...simple? I
: am not being insulting , I really do not know?,

Those reserved words are the core of the language. All those functions and
structures that are added by the libraries are just an aid for the
programmer. It's the same thing with STOS; you have a lot of libraries (Or
extensions as you STOSsers call it.) but they don't modify or add anything
to the language. Are there any extensions that adds structural commands
like WHILE-DO, REPEAT-UNTIL or CASE, or that let's you define and
dynamically create/remove your own datastructures? Nope, only functions.

: BTW the only reason I have not got into C, is that i can find no
: simple tutorials, most start by presuming you already know something
: about C,

Try "C-Manship complete" from Kuma, it's a bit outdated but it's
entertaining and it's Atari/GEM oriented. You should also get "The C
Programming Language" by D. Ritchie, it's the very definition of C and
therefore doesn't assume any previous knowledge to the language.
:
: hmmm sounds good, dunno about good enough for games, but sounds
: interesting :)

I don't know of a good games-library for C either, but as it's very easy
to interface C and assembler it would actually have been much easier to
write "The Missing Link" (Or any other STOS extension) for C than for
STOS.
:
: hmmm I would seem to agree with this, but how many C programmers dont
: know how to compile there own code?

Well, I know how to compile (We're talking about C remember?), but I have
never tried to compile my own library so I don't know how to do that. The
actual compiling-process shouldn't be to hard, it's writing the library

that's difficult. That's why we have libraries...

Well... actually the Control Extension (by Les Greenhalgh - shareware)
adds a CASE statement. :) Oh, and I'm mid way through writing an extension
which dynamically creates/removes data-structures. [TT-Ram only, as
STOS has control over all other memory] :)

You are correct though... (the above use loop-holes)

Hi All

I'd just like to publicly thank the two people who e-mailed me info or offers of info about the AV Protocol. It's so nice to be in a community where this is the norm rather than the exception.

Regards
Martyn

Any chance of posting it for the rest of us? Or pointing us towards an ftp
site if it's too big.

Cheers,

Xav

No, the point Tony is trying to make is that a STOS extension is NOT simply
pre-compiled code. It CANNOT be written in STOS, which is the key difference
between this and a C library.

Sure thing. Below is a heavily commented C header file from Mario
Becroft. Also attached is an Lharc file containing documentation from
Daniel Hedberg. I haven't looked at this yet since I don't have access
to Lharc at work.

Regards
Martyn

* Definition of the Venus <-> Accessory protocol and its messages
*
* 12/07/1993: new messages AV_PATH_UPDATE, AV_WHAT_IZIT,
AV_DRAG_ON_WINDOW
*/

#ifndef __vaproto__
#define __vaproto__
```

```
/* Message numbers for the XAcc protocol of Konrad Hinsen.
* Venus' ACC_ID name is "VENUS.APP", Gemini's "GEMINI.APP".
* Gemini supports the basic messages of the XAcc protocol.
*/
#define ACC_ID 0x400
#define ACC_OPEN 0x401
#define ACC_CLOSE 0x402
#define ACC_ACC 0x403

/* The following defines the message numbers for the communication of
* Venus and other accessories.
* All path- or filenames that occure in messages are supposed to be
* absolute pathnames (including the drive-letter) and drive letters
* have to be upper case.
* All paths end ALWAYS with a backslash!
*
* Messages from Venus start with the prefix 'VA_' (Venus -> Accessory).
* Messages to Venus start with 'AV_' (Accessory -> Venus).
*
* The message 'AV_PROTOKOLL' may be used by an accessory to ask which
* messages are supported. (This is different for Venus and GEMINI!)
* It would be nice, if other programs would support the VA Protocol,
* too!
* The AV_SENDKEY [and ACC_KEY] messages are the only way to send
* key-events to other applications - and these are easy to implement!
* The VA_START message should be supported by all accessories, as
* this is a simple method for applications to start accessories.
*
*
* If a single-tasking TOS/AES is running (ap_count == 1) the accessory
* should send a AV_PROTOKOLL message to application 0 when it is
* started and each time it receives a AC_CLOSE message.
*
* If a multi-tasking AES is present (ap_count != 1) the main
application
* is no longer guaranteed to have to id 0 and the AC_CLOSE messages are
* send quite rarely. On the other hand it is possible for applications,
* too, to communicate with GEMINI.
* Therefore each application/accessory should try to find GEMINI using
* the appl_find("GEMINI ") system call. If this fails, it should look
* for an application called "AVSERVER". Last it should check, if there
* is an environment variable called "AVSERVER" and if this exists, it
* should treat its contents as the name of the avserver-application.
* Especially the last method gives an easy method to configure the
* avserver.
*/

/* AV_PROTOKOLL: This message should be used to ask an application
* (including GEMINI/VENUS) which messages are supported. (see above)
*/
#define AV_PROTOKOLL 0x4700
/*
```

```
* word 6+7: a pointer to the name of the accessory/application for
* the use with appl_find (aligned to 8 characters and
terminated
* by a '\0' byte).
* The bits of words 3, 4 and 5 have the following meaning:
* word 3:
* bit 0: (VA_SETSTATUS)
* bit 1: (VA_START)
* All other bits are reserved for future use and should be set to
* zero (all bits of words 4 and 5 too).
*/

/* VA_PROTOSTATUS: Tell the sender of AV_PROTOKOLL, that the application
* knows s.th. about the VA-Protocol. The words 3-7 of the message
buffer
* contain informations which messages are understood. If a bit is set,
* the message(group) is supported).
*/
#define VA_PROTOSTATUS 0x4701
/*
* word 6+7: a pointer to the program's name (see AV_PROTOKOLL)
* The bits of words 3, 4 and 5 have the following meaning:
* word 3:
* bit 0: (AV_SENDKEY)
* bit 1: (AV_ASKFILEFONT)
* bit 2: (AV_ASKCONFONT, AV_OPENCONSOLE)
* bit 3: (AV_ASKOBJECT)
* bit 4: (AV_OPENWIND)
* bit 5: (AV_STARTPROG)
* bit 6: (AV_ACCWINDOPEN, AV_ACCWINDCLOSED)
* bit 7: (AV_STATUS, AV_GETSTATUS)
* bit 8: (AV_COPY_DRAGGED)
* bit 9: (AV_PATH_UPDATE, AV_WHAT_IZIT,
AV_DRAG_ON_WINDOW)
* bit 10: (AV_EXIT)
*
* All other bits are reserved for future use and should be set to
* zero (all bits of words 4 and 5 too).
*
* AV_SENDKEY is easy to implement in many programs.
* Receiving AV_OPENWIND an application could start its 'normal'
* routine for opening a document and use the given path (e.g. in the
* fileselector). This is together with tools like TreeView a quite
* simple method to open files in different folders.

3891. need info on CPX programming

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-02 00:00:00 UTC
From: q-funk@eclypse.net
Message-ID: <57tbioklo1@cti01.citenet.net>
Source record: 8329

Is there a book, CD-ROM, or FTP document that has *detailed* info about programming a 100% compliant CPX, explaining what is needed to transform a small APP into a CPX that will work on every Atari from TOS 1.0 to 4.04, and specifying any un-documented calls that should be avoided?

The information source should be preferably in English, although, if all else fails, I understand French too.

Thanks to anyone who can provide me with any info about this ;-)

Some people seem unable to grasp the concept of free and open debate. They cannot differentiate between criticizing an idea and a personal attack. The first would involve debating the validity of STOS as a game programming language, the second would involve personal attacks calling you a moron or worse! :-)

What I see here is an open, constructive debate on how and why various programming languages are good/bad for various applications. We can all benefit by finding out how others think, even if we don't agree with them.

Anyone not interested in this thread should merely skip it, not waste their time and yours emailing comments about public debates that they don't understand!

The basic concepts of C are universal, so why not get a book from your library or bookstore on C? Most are written for Dos, but I found that they get you started with basic C concepts and let you write TOS programs. You could then get the Progem series, which are free and at most Atari ftp sites. They are a series on gem programming that came out a few years ago, but still teach you the basics of windows, dialog boxes, etc.

No. You need to patch the entire OS to be able to do the same thing
/without/ using an ACC and without using a multitasker. Remember, there are
only 7 ACC slots available in SingleTOS; using an ACC for one file type (or
collection of types, in the case of N_PLAYER) means using resources that may
be desired for other things.

As it happens, N_PLAYER seems to to the job "properly" with CAB. I'd still
like to see an OS extension allowing this type of thing from the desktop,
though. Even just adding AV_START to singleTOS would be a big improvement.

I never really thought about it that much before. Maybe because I
don't use a debugger, just the good old print statement. Now that I am
thinking about it I guess the answer must be there isn't really a
problem as I use MWC single tasking to run the command shell full
screen or multitasking when I want it in a vt52 window, and both modes
seem to work (or crash) the same with a development program.

Is there any particular area you were thinking about?

> limiting?, from that description?

No, it isn't. The 68000 itself has only 54 different instructions. Never had a problem with that. The simplicity of C is regarded as one of it's strengths. One of the best books about C, 'The C programming language' second edition, by Kerningham and Ritchie, is in the english version only 260 pages and but covers the whole language. It's the only book about C I have and I didn't even read it to the full extend. The first 4 chapters (100 pages) are enhough to get started.

> so <?> eeerm wheres the flair? wheres the programming, is it just a
> shell calling all these libraries?, why does it sound so...simple? I
> am not being insulting , I really do not know?,

Depends on what you are doing. But most command you are using in basic are also implemented as function calls. You don't see it, but a command like print is translated into a call to the print function with a set of parameters. The advantage of C is that you can replace the print command (called printf()) with your own version, because it's defined in a library which you can replace.

> BTW the only reason I have not got into C, is that i can find no
> simple tutorials, most start by presuming you already know something
> about C,

Just get a copy of 'The C programming language' by K&R. Make sure you get the second edition, that covers ANSI C. It's available in most public libraries and in any bookstore with books about programming languages.

> hmmm I would seem to agree with this, but how many C programmers dont
> know how to compile there own code?

Compiling code is no problem. Compiling a library is somthing different. You have to tell the linker how to make the library. I think most C coders never build a library of their own. May be wrong though.

I might be wrong, but even GNAT doesn't cover the whole ADA programming language, but only certain parts of it. And, doesn't GNAT convert ADA to C to compile it with the GNU C compiler?

Oh yes, borland C++ 3.x is a real nightmare, fully agree!

Depends on what type of game you want to make. Only for the Arcade type of game the blazing fast incopmatible screen output is needed. For boardgames, simulation games, adventures, any game not requireing realtime action, GEM is fast enhough, and, because it is working on any TOS compatible machine, GEM is the way to go for those types of games.
Bye, Hans

BTW: did you know there is a game library for Gfa basic? Neighter did I, but I saw one on the fair last Saturday.

Hmm... maybe... from C etc if you compile only a single object with the relevent header info as static const etc. at the top. You would be limited in what you could do (no malloc()'s etc.) but it should work... maybe...

>> A STOS BASIC programmer like myself, cannot write an extension?
>
>Why not? All that's needed is the info on how to add a command and a
>command to add.

No. It would not be possible to use a STOS program as an extension to STOS because the compile always compiles complete executables, which include the initialisation routines which eg. install STOS's trap routines, and there would be no way to put the header at this point...

>That's my point. You could add them yourself. Why not write a tool to
>do it?

No, you couldn't. It would not work without resorting to another language.

>Does the STOS compiler insist on using the source for libraries?

No.

>The compiler can build an executable program without the source code
>for _any_ of the above functions. The only source code it needs is the
>above. So I still maintain that STOS extentions and object libaries
>are identical in terms of use. ;-)

I do not believe that it is possible to build a STOS extension from within STOS itself, which is possible under C. I am not even sure that it is possible to do it with other languages other than assembler.

Yes, but this is not possible without the source code to the desktop. This is why the replacement desktops (thing, teradesk, gemini etc.) support this but NewDesk and Desktop do not.

I think your best solution is to use a replacement desktop, which will support AV_START messages. This is even nicer under a multitasking OS, but you say this is not practical for you. ok - but it is still of benefit under SingleTOS.

Moan, moan, moan! <G> Use a crowbar and lever an extra slot into your TOS!

So you are saying STOS is good for "Arcade type Blazing fast" games
:)

>simulation games, adventures, any game not requireing realtime action, GEM is
>fast enhough, and, because it is working on any TOS compatible machine, GEM is

Yes true, any game that doesent need to move anything, still screens
and GFA etc can handle it, its a matter of opinion if its best,

Cheers.............!ynoT

A typo... But you can virtually increase the resolution by using LaceScan.

>made games will run on the new powerfull ATARI's, and I doubt that
>very much,

Either you include code for all known (and still unknown!) video hardware,
or you have to use GEM. I know at least 9 different video modi for known

video hardware... (st low/st mid/st high are ONE of them, 32 KB video ram
direct accessible via XBIOS pointers, color depth 1/2/4 bit, interleaved
bitplanes. ET 4000 compatible graphic cards are another one, there are
a wide variety of high and true color modi and so on...)

I've never seen a none GEM game that supports more than 2 resolutions.

If you really find a game for a new ATARI, I doubt that it will run
on the different hardware of another new ATARI. (Please pay attention
to the plural in my statement.)

Ohh too bad, a french guy was giving away for FREE his whole
documentation about the DSP for falcon.
You would just have to pay for the postage fees.
It was something like 2 or 3 months ago now..
I think it was frederic mora, I don't remeber his address, you might
ask in comp.atari.st.fr if he still has it..

Hi ..

Today I had a chance to check out a SGI-machine. Not to mention that the whole thing was really impressing (speed/graphics etc) but what I liked most was a demo wich is called (I think) flying buttons.

Clicking on a button caused the button to grow, spin around in a 3D style until it's "backside" filled the whole screen, showing another screen.

Is it possible to implement something like that on the Falcon or under Magic on a faster machine (eg. a powerMac ?)

I hope I'm doing this right...

My name is Janet , Paul Bakers wife

In case you are wondering why you haven't seen much of Paul in the last 3 months or so , I have decided to tell people what's going on as he is still not able to talk about it much.

PLEASE don't reply to this message as he doesn't know I'm sending this , I will be deleting this message afterwards.

Pauls mother died from cancer about 3 months ago , since then he has been in a battle to get his mums items from the theiving bastard that she was living with at the time.

The guy has been constanty hastling his grandfather for money to pay for the funeral even though he was never paying for it in the first place.

This has caused his grandfather who had a weak heart to have several heart attacks , he is currently in hospital under observation.

There is currently a legal battle going on , the guy his mother was living with ordered the funeral (evan though he had not intention of paying for it) , the estate may end up footing the bill , the funeral directors won't release the ashes until the bill is payed.

So that's about it..

Like I said , PLEASE don't reply to this as I don't want Paul to see this , but that's why he's been missing a lot recently.

>work... maybe...

I'm certain it's possible. It being practical is another matter. It may indeed be worth the effort if (say) complex math were required as the C math library could be used, but if someone's math is up to the job and so is their assembler then still no point in bothering.

>No. It would not be possible to use a STOS program as an extension
>to STOS because the compile always compiles complete executables, which
>include the initialisation routines which eg. install STOS's trap
>routines, and there would be no way to put the header at this point...

I'm beginning to get the picture. The "tool" would have to locate all such initialisation, rip it back out and then produce a correctly formatted extention - almost definately an impossible job.

>>Does the STOS compiler insist on using the source for libraries?
>
>No.

Then might it be possible to produce precompiled "functions"? Erm, hang on - how do these libraries work? STOS hasn't any named functions or procedures has it?

>I do not believe that it is possible to build a STOS extension from
>within STOS itself, which is possible under C. I am not even sure
>that it is possible to do it with other languages other than assembler.

It should be possible but intimate knowledge of STOS and the compiler would be needed. A compiler which allows inline assembler might be capable but reguardless how I word it an assembler interface of some kind would be required between the two, if only to preserve registers, stack etc.

Well, look at The change from Papyrus 3.x to 4.0. the 3.x was written in GFA Basic. the 4.0 was written in C. everybody I hered talking about it said that the newer version did not only provide much more features, but also was very noticably faster than the old version. I don't know anything about game programming, but for serious apps Basic does not seem to be the best language.

> structured and powerful as VC++??

I did not try Visual C++. Visual Basic was a serious pain in the ass for me. The Compiled Program was so slow, that even a ST could beat a Pentium with similar Code written in C.

This is definately not because I'm not a good Basic Programmer. I wrote lots of Basic Programs on My old C64, and when I got My fist ST Omicron Basic came with it and so this was the first language I used on it. I never touched Omicron Basic again since I got PureC on my machine.

Another point is that I can use many parts of my code more often. I know, Basic can also use code as modules, but the concept I found with C was miles better than the one I found with Omicron Basic (and that one is said to be good for a Basic). So I don't spend so much time coding everything twice and again.

> : make a serious application that needs GEM you see <duck!>
> Sigh and we were hoping for a decent GEM game... :-)

He said "serious"...

> Visual Basic is more powerful than my C compiler! No easy database support..
> No easy GUI...

Visual Basic is not more powerful than My C Compiler. No Data structures.. No tricks for saving time (Comparisons e.g. can be tuned a lot in C - On a Pentium (to speak about Visual Basic) this is very useful, because it wastes a lot of time for each comparison).

For easy GUI I can use a cool Libary, or tools like ACS. For Database support.. have you ever seen the msql API for C Programmers? Or have you seen embedded SQL for C? Don't tell me that there is a better Interface to relational Databases (Acess - whitch is uesd with Visual Basic - is also a relational Database).

Christof

Well, Sozobon I think does not compile the Standard. It lacks in some
Libaries, and the OS libaries are not in all aespects combatible to
other C-Compilers like GCC, PureC, etc. (they say...)

> how about...eerrm tutorials or something, something for the complete

Try the book by Kernighan & Ritchie. Those two invented C and developed
UNIX in the old days. This is the (IMHO)best book for learning C.

Don't need to. I use Geneva most of the time which gives me unlimited
slots. Still only use four or five though!

>ALL atarians I know own a HD.

Both of them?
90 percent of ATARIans I come into contact with, do not own hard drives, and before I got a modem and went on line, NONE of the ATARIans I knew owned a hard drive,
How many?, well a couple of hundred readers of the STOSSER diskmag who filled in questionaires, only the odd one owned a Hard drive,

ST Format ran polls every year, Hard drive owners where in the minority every year,

Now I am on line, just about everyone you meet has a hard drive (yes I am jealous), but again according to polls in mags, the ATARI on line community only account for ten percent of the whole ATARI community, I think ST Format was a world? wide publication?, so on liners fall into a false sense of ??? eeerm, we on line are in the monority:)

At the recent uk shows, 500 questionaires where handed in, only 7 percent where on line?

>> AW Give us a break, you have to draw the line somewhere,

>> Q when is an ATARI not an ATARI
>> A when it cannot even handle standard ATARI screen resolutions

>have hard drive. It is true.

Please! you cannot say "It is true". you surveyed the online
community that IS a very small part of the actual ATARI community, and
admmitidly the on line community for the most part do own Hard Drives
(mutter mutter<G>)
What about the other 90 percent of ATARIans,

Sorry I in no way mean to belittle your survey,and indeed I was
probably one of the first round to see it:), but it should be pointed
out that it was the on line community, a small minority of ATARI users
:)

I base those comments on the fact that I am involved or read just
about every ATARI publication in the UK, none of which carried your
survey :)

So IMHO it is not true, MOST do not own Hardrives :)

I would agree wholeheartedly, But I already know BASIC and am a
little worried as to how long it would take me to learn C, as I have a
reasonable BASIC head start the GFA should be alright (although I am
finding it harder than anticipated)
I know nothing about C other than some knowledge re: libraries as
discussed in here, it is hard to try and learn a completely new
language, while still using BASIC to make games (of which I am doing)

OK apologies for what are probably really lame questions, but I am
using this forum as a way to get quick and easy answers :)

Why does GFA return 2 bombs when I try to load in a file with the
extension *.LST

I have these as source files? well thats how they where given to me,
and they certainly look like source in a text editor, but GFA 3.5
returns bombs,
This is under Gemulator and tos 206,

From: jacquesa@cs.man.ac.uk
Message-ID: <5849bn$er0@m1.cs.man.ac.uk>
Source record: 8235

Hi

I am trying to start a program using Pexec mode 4 (just go)
and I believe that everything (ie program, basepage etc.)
is set up correctly but it isn't working. Instead of executing
the program, Pexec is just returning an error code of 'EIMBA'
- invalid memory block address.

What exactly does this mean? I assume it means I am doing
something wrong, but what?

Cheers

Anthony

>>with this?
>
>STacy and ST Book are not able to display st low.
>Medusa & Hades (ISA/PCI graphic card) are limited to at least 640x480 pixels.

Well, in my book, anyone who can afford a Medusa or Hades can afford to go
out and by a second hand STE. I think including these machines in a debate
about (primarily) arcade games is pointless. 99% of arcade games go
wrong when played at the wrong speed. This is simply because they are
highly dependent on timings... even the difference between 50 and 60Hz
makes a difference...

>>Games shouldn't really be run ontop of NVDI, MultiTOS, loads of DA's

>extensions...

One example... but in general, most game software prefers clean systems,
even if it is only for the extra memory!
(but both Robinsons Requiem [Falcon] and Zero-5 do not work correctly
if run from 256x640x480 on my Falcon.

>ATARI have sold more monochrome than color monitors.
>This is not representative because you can use a tv set. But all atarians
>I know own a SM 124/144/146/194.

Well, I know 3 atarians with mono monitors, and all 3 of them also have
colour monitors as well. I know significantly more that only have colour
monitors/TV's.

>>And yes, you can even make use of it - I have written myself a .TGA viewer
>>which uses 640x480xTCxVGA mode and hardware scrolling for big images...
>
>Can I use this on other hardware with the same resolution?

nope. written for my own use, with my own hardware. I jst used it of an
example showing that STOS *can* make use of extended hardware, *if programmed*
to. This is the same as other non-GEM software. [Bad Mood v2.15 can now make
use of a NOVA graphics card, *now that it has been written to support it*.]

>(What do you mean with TC, 16 bit high color or 24 bit true color?)

I mean Falcon True-colour mode. 16-bit.

nope, because most of it doesn't make it to this country... ;/

>Why do you want to uninstall atari software? ;-)

hehehe... well, maybe if it is to big/slow?

>>>A faster CPU can compensate slow code. GEM code is mostly slow code.
>>>To make good GEM games, you can compensate the slow but compatible
>>>GEM code with a faster CPU.
>>
>>That sounds like a Micro$oft approach to me...
>
>Is there anything false in my statement? So what...

No, there is nothing false in the above. However, it makes slower machines
redundant. There are FAR more ST's out there than Falcons, TT's and Medusas
all put together, so why make games that the majority of users cannot use?

Yes, fine, write games for powerful machines (I am doing this), but please
do not expect ALL games to be for powerful machines. This is what you are
doing, if you are advocating the use of GEM for games programming.

You gave me the answer in the above paragraph, If I load them in,
BOMBS, but if I MERGE them in, then they load alright?
I never thought GFA would find a difference, i presumed load would
work for both
So to load a LST file, I NEW, then MERGE and its there :)

This is the problem when trying to get to grips with another
programming language, you presume some tasks to be normal :)

Thanks

Yes, and you are forgetting the mighty Atari user base in germany. They don't fill in ST Format polls. In my view ST Format was a game oriented magazine (maybe I got spoiled by german magazines) and I expect a lower harddisk user base among the game adicts.

I did, Stonage works on ST LOW, ST HIGH and TT HIGH. It will work on Amiga's too. It's a great game! Good music, digisound, even on a standard 1040 ST.

Does this impressive list of TOS versions mean STOS is still calling routines at fixed adresses in ROM? I thought these practices were something of the stoneage of Atari ST computing. Something of the pre TOS 1.02 age. If that is true STOS will be in a lot of trouble on ST emulators using magic. Because that OS is software is's much easier to update and you won't be able to keep track of all the different versions of that OS.

The game I am working on now doesn't care about the TOS version. The only point of interest is the hardware it's running on. The OS is only needed for memory allocation and some disk acces at the start and end of the game. Oh yes, also for switching to ST LOW on a falcon and, ofcourse, going to supervisor mode. It will work on ST, STe, TT and Falcon (both RGB and VGA).

No problem.. Usually if you try to load a file that is not a GFA
file, an alert box will pop up telling you so. Either that was a very
odd .LST file or GEMulator has a problem with it.

> But I already know BASIC and am a
> little worried as to how long it would take me to learn C, as I have a
> reasonable BASIC head start the GFA should be alright (although I am
> finding it harder than anticipated)

It did not take me too long. When I started with Omicron Basic I found out rather quick, that structuring programs in procedures and functions is a good idear. I then was impressed by the - definately better - way C deals this. It gives me the possibility to really modularize most of my code.

> I know nothing about C other than some knowledge re: libraries as
> discussed in here, it is hard to try and learn a completely new
> language, while still using BASIC to make games (of which I am doing)

That is exactly where I started. One of the advantages of C is that the structuring of the Programs is very consistent. So there are no special Key words for end while, or end if. Such statements like while or if just handle a block, and a Block is either a single statement, or is some statements written in curly braces.

In short terms C is rather easy to learn (compared to other languages). It took me just a few days to get my first real Program with Grafic Output etc. running. As I said I never started Omicron again since I gon PureC.

Pexec can be a bit tricky.
It is essential that you do the memory handling the right way.
TOS must have a free block of memory that is big enough for
the program. What happens if you call GEMDOS Malloc?
Is there any memory free?

Yea. the maths rout's could be useful, but apart from that...

>I'm beginning to get the picture. The "tool" would have to locate all
>such initialisation, rip it back out and then produce a correctly
>formatted extention - almost definately an impossible job.

yep...

>Then might it be possible to produce precompiled "functions"? Erm,
>hang on - how do these libraries work? STOS hasn't any named functions
>or procedures has it?

no, it doesn't have named functions/procedures. The extensions are implemented by adding extra tokens to the actual language itself. All instructions are represented as a 2 byte code, the first of these identifies which extension (or internal) and the second identifies which instruction. The header of the extension gives the tokens which are understood, followed by the offsets to the code for the instructions.

(btw. extensions are only aware of the instruction token - the extension token is allocated when the extensions are loaded)

The exact syntax of the compiler libraries are different from interpreter libraries. Also, compiler libraries have to be in PC relative code.

>It should be possible but intimate knowledge of STOS and the compiler
>would be needed. A compiler which allows inline assembler might be
>capable but reguardless how I word it an assembler interface of some
>kind would be required between the two, if only to preserve registers,
>stack etc.

Yes, I think you are right about that... Maybe it would be worth me looking at this sometime...

This isn't just the German viewpoint. In the days when the UK had a choice of magazines, ST Format was always the most trivial by far, although it did improve toward the end. I seem to remember an Atari World survey that showed a much higher hard-disk ownership ratio than Tony is implying. It'll be interesting to see the results of the Atari Computing survey from issue 1. Certainly everybody I know personally with an Atari has a hard disk and I live in the UK (the Swedish tag on my e-mail address is just there to confuse ;-)).

Was it?, you write that as if it is fact, that is surely your
opinion, and granted the opinion of many others<G>,

>although it did improve toward the end. I seem to remember an Atari
>World survey that showed a much higher hard-disk ownership ratio than
>Tony is implying. It'll be interesting to see the results of the Atari

But still I think you will admit, the minority?

>Computing survey from issue 1. Certainly everybody I know personally
>with an Atari has a hard disk and I live in the UK (the Swedish tag on
>my e-mail address is just there to confuse ;-)).

aw really, and who where the only people who knew about (the
excellent!) ATARI computing issue 1?, ok maybe not only, but people on
line knew about ATARI computing, not many others did, so any survey
carried out in issue one will be mostly by on liners that we allready
agree are mostly hard drive owners?

Also if you do a survey, and give the option of sending in your
answers via email or by snail mail, then a bigger majority of on
liners will respond, again making the survey a little one sided?

IMHO :)

ST Format IMHO was by far the best magazine ever produced in the UK,
it had everything, yes including mistakes,
The only real gripe I ever had was the page count, but although thin,
they had a lot more pages than anyone else at the end?

At no point in this statement am I saying the others where bad (so
back to your knitting the moaners!) because theye where good, I bought
every one of them, just that IMHO STformat was always the best of the
bunch :)

The problem with ST Format was that thousands read it and liked it,
but it was allways something not many would admit to :)
A bit like the present English goverment, they get enough votes to be
elected, but try finding someone who would admit to voting for them :)

Cheers.............!ynoT

j > - invalid memory block address.

Did you also load the program/basepage using Pexec mode 3?
If not, did you convert the memory references using the fixup table?
Did you pass the basepage address returned by the previous call?

base = (BASPAG *) Pexec( 3, prgm, cmd, envp );
if(base) ret = Pexec( 4, 0L, base, 0L );

Note: if you try to run the program more than once, all initialized
variables (and the command line) will be modified.

Eh? We are talking about gamers!!!!

>This isn't just the German viewpoint. In the days when the UK had a
>choice of magazines, ST Format was always the most trivial by far,
>although it did improve toward the end. I seem to remember an Atari

Woha! hold on there! STF was really good, and not as game orientated
in the early days as well. STF went through a bad patch, but was beginning
to improve again when it went...

>World survey that showed a much higher hard-disk ownership ratio than
>Tony is implying. It'll be interesting to see the results of the Atari
>Computing survey from issue 1. Certainly everybody I know personally

Again, I think this will be biased, as the people who learnt about Atari
Computing are online, or regularly contacting di-hard companies (sys.sol,
goodmans pdl etc.) I was away from uni, and I only found out about it
via the limited email access that I had from home. If I had not had this,
I would not have known about AC until getting back here...

Is there a book, CD-ROM, or FTP document that has *detailed* info about programming a 100% compliant CPX, explaining what is needed to transform a small APP into a CPX that will work on every Atari from TOS 1.0 to 4.04, and specifying the un-documented calls that should be avoided (ie: CONFIG.CPX and others used some calls only known to Atari-commissioned programmers that cause conflicts when running under certain TOS/AES versions, but were reported through various newsgroups)?
The information source should be preferably in English or French, although if all else fails, I almost remember having learned some German in hi-school...
Thanks to anyone who can provide me with any info about this ;-)

Hi everyone,

Is it possible to get Linux running on a 520ST? I know the Linux docs
say you need at least a 68020, but is there any way around this? I'd
also like to upgrade the RAM and such, any advice?

Chris

As far as I can tell, you need at least a 68030 with a PMMU chip. This appears to be just the way Linux was written, and would appear to be very difficult to change.

Cheers,

From: John.Kormylo@7861.conchbbs.com
Message-ID: <12a_9612091525@conchbbs.com>
Source record: 8272

I may have missed a few responses on comp.sys.atari.st due to my 200 msg/day limit (now 400). Also, I'm going to be out of town for a while. Could someone keep track of any additions for me?

The current list is:

English "[3][Cannot load RSC file!][Abort|Search]"
Deutsch "[3][RSC Datei nicht geladen!][Abbrechen|Suchen]"
Nederlnd "[3][Geen RSC-file!][Afbeken|Zoeken]"
Svenska "[3][Kan ej ladda RSC fil!][Avbryt|Leta]"
Francais "[3][Je ne peux trouver |le fichier RSC!][Quitter|Chercher]"

I have several different French translations (all different), all using "trouver" which I believe means "find" rather than "load." rsrc_load() can fail for other reasons than not finding the RSC file. This might be confusing if one has used the "Search" button, which brings up the file selector, in which case you would KNOW whether the RSC file has been found or not.

3980. ANNOUNCE: New MPEG Audio Layer II DSP player for Falcon.

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-09 00:00:00 UTC
From: Tomas Berndtsson <tobe@lysator.liu.se>
Message-ID: <Pine.GSO.3.95Lrindlow.961209223148.12675C-100000@tintin.lysator.liu.se>
Source record: 8273
Cross-posted to: alt.crews.atari,comp.sys.atari.advocacy,comp.sys.atari.st,comp.sys.atari.programmer,comp.sys.atari.st.tech

New version of NoCrew's MPEG Audio Layer II realtime DSP player for Falcon
is out now!!

Latest version is 0.95 with lots of new features from the last one. (0.7)

* Dynamic buffer allocation
* Config file
* Drag & Drop protocol supported
* VA_START message supported
* Keyboard control
* Automatically find the next song
* New buttons:
* Skip to next
* Skip to previous
* Fast Forward
* Count direction

Read more about this product on http://noring.org/mp2 where you also can
get the latest version. It can also be found on ftp site:
ftp://ftp.nocrew.pp.se/pub/nocrew/tos

Download, unpack and blast away with your mp2 songs playing in the
background, taking no CPU time!

Mpeg songs can be found at http://www.iuma.com or ftp://ftp.iuma.com

!!!!!!!!!!!! NOTE !!!!!!!!!!!!
ONLY STEREO SONGS ARE SUPPORTED

Let's hear now what the public has to say about this.

Anders Eriksson, aka Evl of DHS: "BLOODY WELL DONE!!"

I'm not sure if he was talking about the player or his dinner though.

This is a dream coming true for every Falcon user, try it now!!
Send donations afterwards! :)

Tomas

> HELP!!!
> Thanks.:)

Hi!

Inline isn't very good, cause it can only handle 32767 bytes max.

One thing you can do is declare an array of value like this:
To reserve 102400 long words - 409600 bytes.

DIM a%(102400)
ap=V:a%(0)

ap would then be a pointer to the reserved space.

Hope it helps!

3982. Launching a program under MagiC5

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-09 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <81648551_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 8275

I'm very confused and I've looked at the MagiC5 documents.

How can I launch a program (say CAB) from another program, AND leave the original program running?

Magic5 doesn't support Pexec (load,go,don't wait).

Magic5 doesn't 'seem' to support mode 0 of shel_write.
Mode1 is no good because it doesn't launch the program until the calling program has exited. :(

Help!!! Does anyone have any idea how I can do this?

I'm not interested in sharing memory or any of that stuff. Just a straightforward start another program.

Thanks for any advice,

Gary.

I'm having trouble making sense of the docs on the basic ST sound chip. What exactly is its relationship to the floppy drive? When talking to the sound chip directly from within an interrupt {not using xbios}, I get the right sounds, but then can't access A: until after rebooting. I masked interrupts while writing to the psg, thinking it might prevent conflicts, but it doesn't seem to matter. Any ideas? I can post some assembly source here if the solution isn't obvious from this description. -- Mark

> 60Hz makes a difference...

So the debate went the wrong way. We were trying to talk about the best game language and not the best arcade language for ST/Ste. And in a debate about a good game lamguage all types of Atari machines are allowed. Making games for all types of machines is a hard job, requireing a powerfull language. It seems to me STOS isn't powerfull enhough to do this. It's very nice Tony makes cool games with STOS for ST's, but that is not enhough to prove STOS is the best language for games. I had to emphasize the GEM part because that's STOS' the week point making it not the best language for games.

>> Why do you want to uninstall atari software? ;-)
>
> hehehe... well, maybe if it is to big/slow?

I think we are quite lucky here on the Atari platform. Most software can be un installed by simply trowing away the folder it's in. Windhoos software is totally different on this point...

> No, there is nothing false in the above. However, it makes slower
> machines redundant. There are FAR more ST's out there than Falcons,

I am not advocating that all games should be GEM games, but merely that a language has to be able to generate GEM games if it wants the label "the best language for games".

Yes, I see your point. It's not limiting. Most things you call commands in basic are funtions in C. The small standard command set is enhough to do all programming with. I can't give a better explanation. Maybe you can compare it to someone fron China asking if only 26 different characters are very limiting for the english language.

3987. Environment Strings and AES <4.00

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-10 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <11102312_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 8277

Does anyone know how to set environment strings such as BROWSER=C:\CAB.APP in versions of the AES prior to 4.00 (4.00 uses shel_write). Magic uses Magic.Inf similarly so does MiNT. But how do you do it with say, good old TOS 1.02?

All AES's have shel_envrn for reading them, so it seems a bit odd that you can't set 'em!!

Thanks for any advice,

Gary

> original program running?

Hmm, this seems familiar ;-)

I've recently been through the same problem in this very newsgroup. The answer is to use shel_write() mode 1 for MagiC with a shell parameter of 100. Note, with mode 1 you will also need to test if the program to be launched is TOS or GEM (if you don't know this at compile time). Also, if you want your program to run under other multitasking systems as well as MagiC you will need to test for which is in use and use shel_write() mode 0 for MultiTOS and Geneva.

Hope this helps

Regards
Martyn

Hi Tony,
GFA will only allow you to 'merge' *.LST files (as far as I know). If
you try to 'load' it assumes you are trying to load a *.GFA file!

Hmm, this is the second post about environmental varaibles, must be that
time of year :)

You can set environmental variables with several programs, such as
SETENV.PRG or the CPX version. These are available from umich.

Basically, you set up a file with all of the environmental variable
strings, & this is read by the setter program & the variables are set.
This works for TOS,MiNT & probably anything else.

You can set enviroment variables for the GEM desktop and all programs
launched from it with the GEMENV program:

http://sunsite.doc.ic.ac.uk/packages/atari/umich/Programming/gemenv.lzh

Get a PAK 68/3, that replaces the 68000 by a card with a 68030. You'll need at least 4 MB, 8 MB is not wasted at all. I assume you got a large enough harddisk.

If you lack memory as well as the PAK, it's probably cheeper to lay hands on a used Macintosh, the ones with 68030 are really cheap nowadays. If you wanna stay with Atari, look for a used TT.

Cheers Peter

There are ways to do so. The 68030 integrates the PMMU on the same chip.
Linux is a real Unix derivative, as such memory protection and mapping is
an inherent part of the kernel.

Cheers Peter

> description. -- Mark

You haven't locked floppy access. Use the flock system variable to
synchronize your access to the sound chip with the OS. The problem arises
from the soundchip having multiplexed registers. The OS relies on a
certain register being selected, while your interupt fires and selects
a different one.

Cheers Peter

There is one point you are allowed to Malloc memory in an accessory, that is *before* you do the first AES call. That is normally appl_init(), so you cannot have any user interaction before the Malloc. However, files can be read, for instance, as you don't need AES for that, but you cannot use the fileselector to locate it.

With GFA be careful, which command might contain hidden AES calls.

Cheers Peter

System variable the_env at $4BE points to the default environment string.

The problem is that the normal environment string cannot be expanded. You need to replace the string with a larger buffer using a TSR. Then just add on the the end as needed.

Port A of the PSG is used to control certain floppy functions (among other things).
Port B of the PSG is used to drive the centronix printer port.

Bit 6 of register 7 (Noise/Tone Mixer) controls whether Port A is used as input or output, and bit 7 controls Port B.

These bits should always remain set!

No, I didn't say that. When someone is claiming a language is the best game language, without specifying the game types that it's best for, nor the computer you are developping for, such a best language has to be able to do GEM games, it has to be able to generate on Medusa and Hades. Otherwise he has to set some boundairies like 'the best for arcade games for ST's'.

> might prevent conflicts, but it doesn't seem to matter. Any ideas? I
> can post some assembly source here if the solution isn't obvious from
> this description. -- Mark

The drive- and side select of the diskdrive come from the soundchip. With:

```
move #$2700,SR ; disable interupts

move.b #$0E,$FFFF8800.w ; select IO register A
move.b #$00,$FFFF8802.w ; Write 0 into the register

loop:
bra.s loop ; stay here forever
```

the drive leds of drive A and B are switched on, but as soon as you are starting your sound routine the drive leds will go out and you can't get them on again. (Try it, I am sure I am right on this point!). After you started you your soundchip routine the following things won't work anymore:
-drive a
-drive b
-the printer
-the serial port
-the speaker of a TT will not work

All these things are handled by I/O port A of the soundchip. Now what's your problem? When you are playing sound you will make use of register 7 of the soundchip (the Mix-Ctrl register). This register switches sound and noise on and of for all three channels, but also determines the direction of the I/O ports. When you set the 2 highest bits in this register to zero you switch the to I/O ports to input. when I/O A port is switched to input it can't send drive select to the drives and so on. The simplest way is to force the two bits to 1 (by or-ing with $C0), bet better is to set the bits in their original state. I recently patched a sound routine with this problem the following way:

```
save_registers:
;save all traps and hardware registers that are altered
; all registers are save to a space pointed at by A0

move #$2700,SR
.....
```

```
; lots of registers are saved overhere
; and now for the soundchip bit:

move.b #$7,$ffff8800.w ; mix ctrl
move.b $ffff8800.w,d0 ; get the register
move.b d0,(a0)+ ; save it
and.b #$C0,d0 ; get the two highest bits
lsl.w #8,d0 ; make it right for the play routine
move.w d0,io_modify_adr ; modify some code
move.b #0E,$ffff8800.w ; IO register
move.b $ffff8800.w,(a0)+ ; save IO register

....
; end of initialisation code

soundchip_music: ; the soundchip routine
lea $ffff8800.w,a6 ; use a6 as soundchip base
movem.l music_data(pc),D0-A4; the music data that has to go to
; the soundchip
move.l d0,(a6) ; write d0 to the sounchip, in this
; routine d0 contains the data for
; soundchip register 0 and so on
move.l d1,(a6)
move.l ...
move.l d6,(a6) ; sounchip register 6
and.w #$3f00,d7 ; clear high bits for register 7
io_modify_adr equ *+2
or.w #$c0000,d7 ; this number willbe modified by the
; init routine
move.l d7,(a6)
....
```

You can also make sure the data for soundchip register 7 gets the right bits set in the music routine itself. Make sure you write all soundchip data to $ffff8800 and $ffff8802. On an ST you can write also data to the following adresses (so you can use a movem.l to set de soundchip registers (movem.l d0-a4,$ffff8800.w), but this will not work on a Falcon because the soundchip registers aren't mirrored anymore, instead of sound you will get a bus error on a Falcon. Second: the official hardware adress of the soundchip is $ff8800, but in all atari hardware it's also at $ffff8800. In the hades it's only at $ffff8800. This way they can use all memory as ST RAM and the RAM will be continues (otherwise there had to be a gap from 14Mb to 16Mb for the hardware registers and cardridge port and so on). SO you can savely use adress $ffff8800 as soundchip adres.

Hope this helps, Hans Wessels

It is only allowed under MultiTOS.

On normal TOS it won't work.
The problem is that most of the time you won't notice that it doesn't work.
Because they can't see any problems many programmers think that it works.
But belive me IT DOES NOT WORK !

TOS will think that the Malloc was done by the main application so if the
main application terminates TOS will make the memory free again. And
when the next application allocates memory....crasch....

Well I was led to believe that STOS could be made to work on the
Madusa etc as soon as the author of the STOS Generic fixer finds
someone with such a machine that can offer 5 minutes of co operation,
this is one of the reasons we cannot support the TT, well someone has
come forward now so TT will be supported in the future, so presuming
the above is correct (Anthony??) then who needs GEM ?

Ah... well, I would say that is only necessary if it is to be labeled "the
perfect language for games". I would suggest that in the abscence of
any alternatives (which is what Tony was trying to establish), an imperfect
languague can still be the best...

Not true. I have only recently come on line (about 6 weeks ago) and I heard about it from about three different sources prior to the first issue (although one of them was a friend who had been e-mailed details :-)). I got the first issue before going on line.

> ST Format IMHO was by far the best magazine ever produced in the UK,
> it had everything, yes including mistakes,

I read ST Format from issue 1 of ST/Amiga Format and didn't miss an issue. In the early days I learned a lot about my computer from it but after a while they were simply recycling stuff that had been done before either by them or other magazines. They also never raised the level of expected user competency. It was great to have everything explained in noddy language to begin with but after a while I grew out of it. IMHO Format's credibility plummetted when Paula Richards was editor and never really fully recovered despite the valiant efforts of those that followed.

So why did I keep buying it? Well, there wasn't a lot of choice was there? I remember being very depressed when Review folded since the only support we were going to get was from Format. This may, of course, have had something to do with me spending GBP700 on a Falcon about a week before :-(. When Format went it was sad but didn't really hit me as hard despite it being the last UK news-stand publication.

As someone whose primary interest is games (I believe), I can see why you liked Format so much. However, even you must admit that hard-core games fans have become a little thin on the ground on the Atari in recent years. This is where Format's problems stemmed from. It's difficult to write about games when none are being released (though they had a bloody good try) and, IMHO, this was no longer an area where most of their readers interests lay.

Regards
Martyn

4009. g++ and gdb

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-11 00:00:00 UTC
From: mdw@liverpool.ac.uk
Message-ID: <E29AqF.EGz@liverpool.ac.uk>

I've got a bit sick of using plain C, especially after working in C++ in work on PCs and unix machines, so I've decided to switch from Lattice to gcc/g++ for my atari stuff. I downloaded all ofthe latest bits and bobs from the umich mirror on imperial, and have managed to get gcc compiling (apparently quite happily). Unfortunately I don't seem to be able to get gdb to work with the rest ofthe tools. I've used sym-ld to generate a symbol table, but gdb keeps on telling me it can't read teh symbol table file, and suggesting I use the -mshort option (I've tried compiling with mshort, by the way, and usingthat, but gdb still gives the same errors). Unfortunately I don't have an atari to hand at the moment, so I can't remember the exact errors and version numbers (ie, the useful stuff :-), but does anyone recall any incompatibilities between gcc and gdb versions? Or have any ideas I might try?

Incidentally, how good is g++ on the atari? I use Borland C++ v4.5 on PCs, and the latest g++ on unix - what sort of things am I likely to find misssing? Any bugs I should look out for?

I'm not sure how frequently I can check this group, so I'd appreciate it if any replies could also be mailed to me at abaddon@nasoftwr.demon.co.uk

Thanks for any help,
Kev

Daniel is 100% correct, believe me. Never do a Malloc() in a desk
accessory after the first AES call! Before that point is OK, as the memory
belongs to the desktop. This does not apply if you are using Geneva or
MultiTOS, since they both treat each process individually.

For a similar reason, you have to be careful when leaving files open (that
is, they haven't been Fclose'd) in a DA. Let's say I open a file and then
the user quits the main app. Since the file handle actually "belongs" to
the app, the file is automatically closed by GEMDOS. If the DA then tries
to use the file handle, it will get an error message at best or, at worst,
start writing to a file that has since been opened by another app.

The moral of this story: always close files you open in a DA, or at least
be aware that they may get closed for you. In fact, you can assume that if
you have received an AC_CLOSE message and you are singletasking, that the
file has been closed by GEMDOS for you. Don't try to write to the file
after that point.

Hans, is there a small program to go in the AUTO folder and swithc off the TT Speaker? I could unplug it, I suppose, but I hate to diable hardware when software can switch it on and off. The reason I would ike to do it in the AUTO folder is that I am running AWAV, and there's no volume control until after GEM loads; I can control the external speakers easily enough with the knob on the amplifier, but naturally that has no effet on the TT's internal speaker.

I don't see why not. An ST could probably get away with it even
because there a lot less screen data to shift.

Katherine L Ellis <kellis@primenet.com> said:-

>Hi , WHat is the best way to manage memory in ACC?

The problem with Malloc in any accessory is down to multitasking. Even in standard gem this occurs, between the main application and the loaded accessories. Each process has a unique identifier which is written to a special place when a particular process is active. That way, when a process terminates the system resources allocated to it can be returned.

>I've read that Malloc is no good in ACC. True or not?

When an acc is loading it is the active process. Gem can only task switch when a program makes an aes call, appl_init() typically. Standard gem will *truly* taskswitch from an accessory to the main application but *never truly* back from the main application to *any* accessory. The end result is any memory obtained after appl_init() will almost certainly belong to the main process instead of the acc.

When the main process terminates, the accessory loses all memory it obtained after its first aes call but keeps what it obtained before its first aes call. When the next application is started - disaster, because both it and the acc are using the same memory area(s).

>If true what would be the solution?

The general solution is only to Malloc() before appl_init(). If your acc is unable to tell at load time how much mem it needs, you can do little more than provide a facility for the user to specify how much of a chunk it should get at this time then provide your own memory management routines. StiK for instance, does exactly this via the ALLOCMEM variable.

A more specific solution for standard gem is to momentarily hack the accessory id into the memory location used for the active process. It works but requires some tricky programming because the memory location moves in different gem versions. Worse still - you must cater for all the different operating systems where the hack may or may not work at all. Magic for example, has no such problem - you can Malloc() as and when you feel like it anywhere in your accessory. As for MiNT and Geneva - I dunno about them.

>and could you show me an example, do I have to use reserve? inline? or
>what?

Dunno any GFA but you must ensure there are no Malloc() calls made
after the first aes call, by you or internally by some GFA routine you
might use.

Thanks for all the advice guys, especially Hans. I had thought register 7 of the psg was the root of the problem, but I didn't have any good source code examples to guide me. I'd actually disassembled part of the TOS ROMs, I was so desparate. There in the system sound daemon I found the top two bits being always set, as John says. But it didn't work for me, I'm not sure why. Maybe it has to do with 'flock' as Peter says, but I thought that was just for DMA. At least that's what the Compendium says, though it's been wrong before.

While I'm grousing about confusing documentation, anyone ever notice that the psg register numbers in the Yamaha documentation supplied with the old developers' kit don't match those in the Compendium? Yet in this case the Compendium is apparently right and Yamaha wrong. Gah!

Anyway, here's the solution I came up with. It seems to work without stepping on the toes of any devices.

```
sound: ; expects a0 to point to 14-byte sound packet, uses d0-d3/a1-a2
move.w #$-7800,a1 ; a1 -> psg reg select
move.w #$-77fe,a2 ; a2 -> psg data
moveq #0,d0 ; register counter
moveq #14,d1 ; for loop end test
move sr,sr_0 ; store proc flags
or #$700,sr ; disable interrupts
.loop: move.b d0,(a1) ; send register number
cmp.b #7,d0 ; mixer control register requires
beq.s .is_7 ; special handling
.not_7: move.b (a0)+,(a2) ; write to register
bra.s .comn
.is_7: move.b (a2),d2 ; read mixer control register
and.b #$c0,d2 ; mask
move.b (a0)+,d3 ; get our data
and.b #$3f,d3 ; mask
or.b d2,d3 ; this way we write our six bits
move.b d3,(a2) ; while leaving the other two alone
.cmn: addq #1,d0 ; next register
cmp.w d1,d0 ; see if we've filled up to reg 14
bne .loop
move sr_0,sr ; restore proc flags
rts
. . .
sr_0: dc.w 0
```

> the above is correct (Anthony??) then who needs GEM ?

Now you are thinking a bit too simple. Maybe getting TOS data out of a Hades will fix STOS for a Hades (the cludge must go on). It still doesn't solve the problem of writing GEM games. The fact you don't like GEM doesn't mean other people don't want to write GEM games and secondly, the argument GEM being too slow is only a real concern for arcade games. Simulation, board and puzzle games don't need the blazing speed of direct screen manupulation. Why going not portable when you can write portable (=GEM conform) games? Especially when speed is not the main factor.
Secondly fixing STOS for a Hades does only mean that the program won't crash on a hades. Your games still won't work. New STOS upgrades are necesarry to get acces to the video memory of the Hades. So you have to own a Hades to write games in STOS for it. GEM games can be developed on every TOS compatible computer an will run on all other computers. (For the kintters among us: I am not telling Tony should write GEM games, nor that he should write games specially for the Hades. I am just telling that GEM programming is the way to go if a game should work on any TOS compatible machine.)

> establish), an imperfect languague can still be the best...

I think C is a good alternative. It will do all the GEM stuff. Doesn't need any fixing for TOS versions. And has the ability to do all the direct memory stuff needed for the fast arcade games. C isn't the perfect game language too, but is more all round than STOS is. I cam up a chess game written in C (GNU chess) and with serveral GEM games. The only thing I didn't show is an arcade game written in C that matches Tony's Heartland., On the other it is agreed STOS is useless for GEM. So I think C will be the best language to write games in and the only question that remains un answered is 'Can C beat STOS on the arcade game level?'.

>description. -- Mark

It seems to me that you have disabled the disc drive. You see, one of
the registers (I think its register 7) controls the PSG states. Now, the PSG
has two parallel ports, Port A and Port B. I think (Dont have any docs with
me at the moment! This is all from memory) Port B controls the disc drive.

With this you can toggle the drive lights on and off (cool!), turn the drive
motors on and off, also you can very handily disable the drives.

So, to sum up, it seems that your code must be touching ports A and B.
(regs 13 and 14). If you like, you could e-mail me some code (I will get
back to you after the new year thogh!), and i'll do my best to sort it out!

Hello
I use an atari falcon, I am wondering what the minimum specs (HD space, Ram etc) would be to run the following...

Minix (min partition size for a V2 filesystem)
XWindows (does this need mintnet, if so what does that need)
GCC (Space to run in...)

Currently I an using Mint V1.12 & Geneva 5 (GNVA_TOS.PRG still does not work though with mint miniwin works fine)

Basically I would like to know what I have to do before messing about with repartitioning my HD.

Also how do programs that don't know about long filenames cope under minix when given them? Does minix crop them to 8+3 or do you get rubbish? I.e. how useful is minix if you have older programs.

Thank you for any help either emailed to me or posted here.

>for GEM. So I think C will be the best language to write games in and the only
>question that remains un answered is 'Can C beat STOS on the arcade game
>level?'.

NO is a quick and easy answer :)

Its been said, STOS is not perfect, but still the best around

STOS is unrivaled in the catagories stated, ie: BASIC and C
STOS Cannot do GEM
therefore STOS is what? 90percent compatable, the only machines it
would fall down on are Hades and Madusa types, I dont think complaints
would come flooding in from those quarters?

GEM made are fully compatable but can only handle board type games,
where STOS can handle arcade AND board type games?

I still feel STOS would taking the above into consideration be the
wisest choice, The only draw back STOS has is a slight compatability
problem with SUPER comuters, the only drawback other BASICS and C have
is they cannot manage anything that needs speed,timing and power, the
choice is easy :)

Cheers.............!ynoT

I haven't got a program right of the shelf, but I did write two small programs
for you doing the task. They both toggle the TT speaker on/off.

The first one is assembly:

```
pea fixit(PC)
move.w #$0026,-(SP) ; Supexec
trap #14 ; xbios
clr.w (SP) ; Ptrem
trap #1 ; Gemdos
fixit:
move SR,D0
move #$2700,SR ; shutup interupts
lea $FFFF8800.w,A0 ; soundchip
move.b #$0E,(A0) ; select register $0e
move.b (A0),D1 ; get current data
eori.b #$40,D1 ; toggle speaker bit
move.b D1,2(A0) ; write new data
move D0,SR ; restore sr
rts ; done
```

It assembles into a 74 byte program. Purists will say it's a bit dirty. I agree
with that.

The second one is in C:

```
/* toggle TT speaker on/of */

#include <tos.h>

int main(void)
{
char data;
data=Giaccess(0, 0x0E); /* get data */
Giaccess(data^0x40, 0x8E); /* write (data XOR $40) */
```

```
return 0; /* exit succes */
}
```

It will be compiled into a program of about 500 bytes (depends on how smart the compiler and linker are).

The programs are not tested since I don't own a (working) TT, but I think they both will work.

I hope this information is enhough for you the get the speaker switched on/of with your own program. Otherwise drop me a message and I will mail you the program.

Bye, Hans Wessels

: Hello
: I use an atari falcon, I am wondering what the minimum specs (HD
: space, Ram etc) would be to run the following...

As always, more is better. 4 megs of RAM will work for what you want to
do, but it'll be a tight squeeze. I've heard 10-15 megs as a minimum for
a complete GCC/XWindow install, although that's likely on the small side.

: Minix (min partition size for a V2 filesystem)

There is, as far as I know, no minimum. There may be a maximum (512 megs,
IIRC), but it's easily gotten around by using symbolic links to the
unified file system to make the partitions transparent.

: XWindows (does this need mintnet, if so what does that need)

XWindow requires MintOS, which in turn should be used with MintNet.

: GCC (Space to run in...)

Can't say for certain, as I don't have GCC installed myself :P

[...]
: Also how do programs that don't know about long filenames cope under
: minix when given them? Does minix crop them to 8+3 or do you get
: rubbish? I.e. how useful is minix if you have older programs.

Programs that use the fileselector will work fine. Filenames are cropped
to 8+3, and converted to upper case. Files with the first 8 characters
identical, and identical extensions _can_ somehow be distinguished,
despite the fact that they show up with identical filenames under the 8+3
convention. There are various options you can set to control the
translation between TOS and MinixFS filenames, but I haven't played with
them. Essentially, reading is virtually transparent, writing may not be so.

4027. Atari 1040ST 1meg ram, dual floppies, color monitor

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-12 00:00:00 UTC
From: Blake Moore <bmoore@www.carolinanet.com>
Message-ID: <32B0FDA8.11DC@www.carolinanet.com>
Source record: 8170

Atari 1040ST 1meg ram, dual floppies, color monitor, mouse, joy stic,
software atari 1st word, vip proffesional, starglider, flight sim, and
other games, all original doc's and software, everything works fine, is
in very good shape,
This is a nice machine, but just isn't being used, won't to sell, will
ship COD + shipping, make an offer.
bmoore@carolinanet.com

4028. MIDI Switching Box Plans For Sale

Newsgroup: comp.sys.atari.programmer

MIDI Switching Box Plans For Sale

Have you ever fumbled around unplugging and plugging in MIDI cables from one device to another? Here is a fast, easy way to switch MIDI cables on computers, synthesizers, samplers, drum machines, effects boxes; any MIDI device. It eliminates the need for swapping cables. Anyone with more than one MIDI device should have one or more of these. Professional and home recording studios will find this item indispensable.

The MIDI Switching Box (MSB) can be used for a number of varied and useful applications, from a simple MIDI on-off switch, to a switching component in an advanced MIDI studio. You will find many uses for this simple and economical device. We use them all the time to quickly reconfigure MIDI devices in the studio.

While you can buy a MIDI Thru Box that will split a MIDI output signal into four or more outputs, it will NOT reroute data from one place to another. You need a switch box for this.

So, if you want to reroute MIDI data from one device to another, you can:

1) Get up, reach around your equipment, and unplug and plug your cables,
2) Buy an expensive electronic switcher,
OR
3) Build the MSB, and reroute your MIDI data stream simply by throwing a switch.

Swapping cable hassles are history!

Here are some things you can do with the MSB:
1. Switch a slave keyboard (or any MIDI device) on and off.
2. Switch a master keyboard to either of two slave keyboards/modules.
3. Switch a master keyboard to either a slave keyboard or sequencer/computer.
4. Switch a slave keyboard to either a master keyboard or sequencer/computer.
5. Switch a sequencer/computer to receive MIDI from either of two keyboards.
6. Design any other configuration, depending on your needs.

Assembly is straightforward, just a few tools and soldering iron, and should take less than an hour. All part are available at your local electronics store for under $10.

Complete building instructions, parts list, and studio configuration diagrams included.

MIDI Switching Box Plans
Price:

$5 (U.S. / sent first class)

4030. Re: Mint, Minix etc

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-13 00:00:00 UTC
From: Dale Philip Needham <needhadp@eng.derby.ac.uk>
Message-ID: <32B149B7.22D4@eng.derby.ac.uk>
Source record: 8173

On the night of posting the first article I tried to get things working The version of minit.ttp I had is old, it will not protect the file system. It comes up with the error that it needs 512byte sectors for a null file system. How big is a partion this size?

I also have a newer version of minit.ttp, which runs fine, V2 file system the lot including protection, however it crashes about 5 seconds after accessing a minix partition every time.

I have no problems with mint, it runs fine. Both the version with multitos and 1.12 that came with geneva 4. However the GCC doc files state that a real file system is needed, i.e. minix given the problems I have getting that to run and stay running does anyone know of a way to get this to work on a falcon?, P.S. the "mint distribution kit" has a good install package, which also doesn't work on a falcon....

[probably the falcons fault, maybe I should have upgraded my old 520STFM to 4 Meg after all, still don't like the idea of de-soldering the video shifter however.....]

If anyone has got GCC running on a falcon please, please help....

Thank you

Dale Needham

Sectors are always (or nearly always) 512 bytes. They can be clustered to increase the partition size. In any case, you should be using the newest version of minit and related utilities.

: I also have a newer version of minit.ttp, which runs fine, V2 file
: system the lot including protection, however it crashes about 5 seconds
: after accessing a minix partition every time.

What hard disk driver are you using? Many people (myself included) have problems using the ICD drivers, especially on larger (i.e., formerly BGM) partitions. Recent versions of AHDI, CBHD, and HDDriver should work fine.

: I have no problems with mint, it runs fine. Both the version with

A better choice, if you want to go the route of a distribution kit, might be Knarf's German Mint Distribution (most recent), or (slightly less recent) the TAF distribution kit.

: [probably the falcons fault, maybe I should have upgraded my old 520STFM
: to 4 Meg after all, still don't like the idea of de-soldering the video

Trust me, running Mint on an 8 MHz machine is not fun. Nor is doing development work without memory protection. Your Falcon is definitely a better Mint platform.

That should do it. Since the whole thing uses only integers, even GST C
should compile it. I'll give it a try tonight, thanks!

> would come flooding in from those quarters?
>
> GEM made are fully compatable but can only handle board type games,
> where STOS can handle arcade AND board type games?

STOS was not written to use GEM for very good reasons:

1) It came out a while ago so less than 512Kb RAM available on 520's -
even less under GEM!!!
2) Having to wait for GEM to load up - even worse if TOS was on disk :)
(Non-GEM means able to be run from bootsector loader or auto-folder)
3) Booting the game on a clean system meant that compatibiltiy is *increased*

What other commercial games of that time run under GEM? Not many! Actually,
even some modern games have problems with GEM/accessories/etc.

The GEM version of "nethack" which was written to run on all GEM machines
has major problems on certain falcons reading the mouse & keyboard! It was
written in C and still can't get 100% compatibility. I don't think you can
ensure 100% compatibility no matter what language you write in.

Look at the PC scene... most games are not designed to run under windows (a
DOS shell in windows maybe - but then it's still under DOS)

Even when coding in C or 680x0 I wouldn't choose to write arcade games in
GEM - simply because it would be too slow!

BTW: STOS runs fine under the STonX emulator on PC linuxboxes & Suns :)

Now can this thread die in peace?

[snip]

You say the safe point for malloc in an ACC is before the very first AES call. But the way I had learned, you do a wind_update(BEG_UPDATE) first (after appl_init, obviously, but before entering the evnt_multi loop of the ACC) - which will hold the GEM Desktop since it too will call wind_update(BEG_UPDATE) before drawing the desktop on screen. You can then let your ACC undisturbed do malloc and load files and, only when this is done, call wind_update(END_UPDATE) to release the screen and let the Desktop proceed with its initialization.

The argument against this use of wind_update(BEG_UPDATE) is of course that it isn't exactly what it was intended for: signalling the intent to draw on the screen (which our ACC won't do), but it works anyway since the GEM Desktop should always call it before drawing the desktop. (Except I heard there was a bugged version of TT TOS that didn't call wind_update before drawing.)

But maybe my learning is old. Is it equally safe (or safer?) to do these things simply before the very first AES call?

> things simply before the very first AES call?

Sorry, but this is wrong. Memory allocation has nothing to do with=20
drawing on screen. Deducting that you may call Malloc because the screen=20
```

is locked is wrong.

The culprit for the problem with the Malloc is that GEMDOS (Malloc is a=20
GEMDOS call) is a single-tasking system that does not know anything about=
=20
the multi-tasking capabilities of GEM-AES. That leads to the situation=20
that two programs (the main application and your accessory) can be=20
running, with the app being able to terminate. GEMDOS does not know that=20
there is more than one program running, so any Malloc'ed memory blocks,=20
regardless whether ordered by the app or the accessory, belong to the one=
=20
program GEMDOS thinks it is running. If the main app terminates, GEMDOS=20
releases all these blocks, because it thinks the one program is gone.=20
However, the acc is still there and might proceed accessing the memory=20
it ordered, which is illegal now, because GEMDOS released it, and thus=20
leads to a crash.=20

Thus the only thing that counts is whether the app that is running at the=
=20
time the acc does the Malloc, is capable of termination, or not. If you=20
do the Malloc before the first AES call then it is the AES themselves that=
=20
constitute the program, and the AES will never terminate.

If you do it any time later then there might be another program running=20
which eventually will terminate, and cause a crash this way.

Deducing that you may stop execution of the desktop before another=20
program can be started by calling wind_update is nonsense. Already with=20
TOS 1.4 (AES V1.4) the AES can auto-start an application instead of the=20
desktop, which can be terminated. So again a crash will follow if this=20
happens and the accessory had the silly idea to call Malloc and frame it=20
with wind_update.

Cheers Peter

4039. wierd problem with C and fopen...

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-16 00:00:00 UTC
From: jacquesa@cs.man.ac.uk
Message-ID: <593i32$69r@m1.cs.man.ac.uk>
Source record: 8182

Hiya

I have had a wierd problem under Lattice C with using the
fopen (or Fopen) call. I have a structure which contains
info about the contents of a window, which includes the
filename which it is associated with.

With the following code the fopen fails, with _OSERR
indicating file-not-found, but only the first time it
is called (subsequent calls succeed)...

```
handle=fopen(cur_wind->filename,"ra");
```

while the following code always works:

```
strcpy(tempstring,cur_wind->filename);
handle=fopen(tempstring,"ra");
```

anyone got any ideas why this is? is it a bug in
lattice or something?

Anthony

Hi,
To be short. I'm looking for a way to get into object oriented programming for the Falcon. I have Pure C but pherhaps a C++ compiler makes it more easy. If anyone has experience with this sort of programming, can you please help me out and get me started.

I already programmed with (spit) MSVC++ 4.2 (spit). Although this is a (spit) Microsoft (spit) product, it still is better than writing tons of listings nobody else can understand.

Pherhaps with the C++ compiler you could have the same sort of programs for Atari as Delphi and stuff like that. This would mean more Atari software could be made.

Otherwise I should get as much libraries as possible to use them for making software.

Thanks for your attention

Cross-posted to: comp.sys.acorn,comp.sys.acorn.advocacy,comp.sys.acorn.programmer,comp.sys.amiga.programmer,comp.sys.amiga.multimedia,comp.sys.atari.programmer,comp.sys.be

For those who might possibly be interested, an _informal, non-official, non-Apple-sanctioned_ discussion about the design of a new graphical user interface and windowing system for the next generation of Macintosh operating system is talking place on the GX dev mailing list and the AIMED-talk mailing list [see sig for subscription info].

Background:

Apple Computer's attempts to create a transitional operating system have failed, at least partly due to a lack of a pre-emptive multitasking-enabled graphical user interface and windowing system in their transitional OS design.

The design of Apple's original graphics library [QuickDraw] didn't allow for a simple transition to PMT, and the shipment date for their transitional OS slipped beyond commercial viability. To make matters worse, former management didn't have a fully-PMT GUI waiting in the wings, so now Apple is without a transitional OS *or* a full-featured OS.

Fortunately, Apple has available the most powerful 2D graphs library ever implemented on a desktop system: QuickDraw GX.

[before you flame, look through the programming manuals via the GX Fan Club GXDev page listed below]

GX was designed to be a PMT-able graphics API. It is an object-based, vector-based graphics library with very robust features. It was designed from scratch with desktop publishing for 2-byte languages in mind. It was designed from scratch to be a cross-platform library (at Comdex, Apple demoed a Netscape plug-in that displays GX graphics under Windows 95). With GX, all graphical objects are called shapes. Shapes can be collected in larger groups called pictures. All operations available for shapes are available for pictures. Even text is considred a kind of shape, and all shapes can be used for masking and other special effects purposes.

Proposal:

A number of us have noted these useful qualities of GX and have decided to try to design a next-generation GUI for the Macintosh based on QuickDraw GX. Due to the object-based nature of GX graphics, GX GUI elements would be remarkably powerful:

*Any GX graphical objects or set of objects can be transformed using a 3x3 transformation matrix.

*Transparency and coloring issues are resolved using powerful attributes found in "ink objects."

*In-place editing of text that follows an arbitrary curve (rotated/skewed/etc is optional) is only two or three steps of complexity beyond the standard "Hello World" program when using GX calls.

*Transforming a GUI element from one type to another would be trivial using the GX library since any shape object can store arbitrary data in "Tags," which could be used to store GUI-specific data.

*Menus could become docking stations for any arbitrary GUI element, including another menu, merely by using the already existing GX API.

*WIndows could be skewed or rotated or given a 3D perspective and rotated *into* the screen or merely scaled [allowing full view of 2 or more windows' contents as they are updated] using a simple 3x3 transform matrix.

*OS language localization issues are relatively trivial because the GX font model was designed from scratch to handle single and double-byte languages desktop publishing issues.

*Because GX was designed with PMT in mind, the issues that Apple faces to implement GX with full pre-emption are likely to be far less costly and time-consuming than any other options available for them to create the next-generation MacOS GUI.

*Because GX is available already, a "shell" could be created to allow Macintosh developers to share a common code base between the current System 7 and the not-yet-released MacOS 8. THis would provide a MUCH larger customer base than would be available according to current rumors of an entirely new API with no backwards compatibility.

*An Windows Manager and GUI API based on GX could be designed to be as robust and simple to use as the Mac's user interface itself.

*Because GX was designed to be cross-platform, in theory a GX-based GUI could be ported to any platform, including the Internet.

The discussion of how to implement a GX-based GUI and Windowing system is taking place primarily on two mailing lists: GX Dev and AIMED-talk. Subscription info can be found in my sig.

Anyone interested in discussing issues related to implementing a GUI and Windowing system based on the most powerful 2D graphics library available on any platform

[yes, I know about Display PostScript]

should consider monitoring and contributing to these discussions on the AIMED-talk and GX Dev mailing lists. We believe that a GX-based GUI is viable and the best solution for Apple's immediate OS problem. Apple engineers are known to be monitoring this discussion, so it is conceivable that the ideas generated may actually be used in the next-generation Mac OS. At the least, the discussion should generate some interesting ideas

concerning cutting edge user interfaces and PMT-aware windowing systems
when using vector-based, object-based graphics.

I don't read most of the newsgroups that I'm posting this to, so any
feedback/questions/flames will have to be sent via e-mail.

Thanks for your time.

This is something I've been thinking of for a long time (approx. 2.5 years)
and I never quite seen to get down to it. A thought for you all: I've seen a
program which (by judicious use of nobbling Trap #2, I think) disabled the
zoomboxes and speeded up the desktop by some small amount. Could the same not
be done in reverse, so to speak, by installing a routine which draws,
basically, a prettier zoombox? What I had in mind was, admittedly, grabbing
a chunk of screen bitmap (vro_cpy...etc) and kicking it until it looked like it
was texture-mapped over a spinning box, but I suspect wireframes may be both
easier and quicker. Thoughts?

Follwup - tried it, GST C didn't like it (and I can't see any reason why
not). Wrote a similar routine in HighSoft BASIC, which appears to work, but
doesn't actually /do/ anything. Should I switch to supervisor mode before
accessing the GI chip?

You'll need at least a 68030 CPU and 8 MB RAM at least to run X-Window
properly. LiNUX requires built-in MMU, which only 68030, 040 and 060
has.

Keep Cool and Flying...

> Don't need to. I use Geneva most of the time which gives me unlimited
> slots. Still only use four or five though!

Using a multitasking system really makes .ACC's irrelevant. Just start
everything you need to run as applications and bingo! :-)

I normally run 8 applications in the background (GemView, ST-Guide, LZH-Shell etc.etc.), so
that they're always ready for use when I double-click on a - say
.LZH-file it gets piped to the LZH-Shell via the AV-protocol. The memory doesn't
get so fragmented either when programs are run as applications instead of ACC's.

Keep Cool and Flying...

Yeah. Why should people pay you money for a few sheets of printed
information that is easily available at Hyperreal/Harmony-Central?

Anyone want to send me money for details on how to wire audio cables?

Anthony.

THERE'S STILL TIME TO GET ATARI STUFF IN TIME FOR CHRISTMAS!!
-------------------------------------------------------------
Our unique selection of Atari hardware and software (Lynx, Jaguar, and
ST!) is the perfect gift for the Atari fan on your Christmas list, and
if
you're the Atari fan, giving hints to the ones you love is certainly
encouraged!!

Here's a list of some of this year's hottest sellers:

LYNX GAMES

Games List & Prices as of Dec 11, 1996

A. P. B. $19.95 NFL Football $39.95
Awesome Golf $29.95 Ninja Gaiden $29.95
Basketbrawl $19.95 Pacland $19.95
Baseball Heroes $19.95 Paperboy $39.95
Batman Returns $19.95 Pinball Jam $19.95
Battle Wheels $39.95 Pit Fighter $19.95
Battlezone 2000 $39.95 Power Factor $19.95
Bill & Ted's $19.95 QIX $19.95
Ex. Adventure
Blockout $19.95 Rampage $19.95
Blue Lightning $19.95 Rampart $19.95
Bubble Trouble $39.95 RoadBlaster $39.95
California Games $39.95 Robosquash $19.95
Checkered Flag $39.95 Robotron 2084 $19.95
Chip's Challenge $19.95 Rygar $19.95
Crystal Mines II $19.95 Scrapyard Dog $19.95
Desert Strike $39.95 Shadow of the Beast $19.95
Dinolympics $19.95 Shanghai $19.95
Dirty Larry $19.95 S.T.U.N. Runner $19.95
Double Dragon $29.95 Slime World $19.95
Dracula $19.95 Steel Talons $19.95
Electrocop $39.95 Super Asteroids/ $39.95
European Soccer $29.95 Missile/Command
Challenge Super Off Road $39.95
Gates of Zendocon$19.95 Superskweek $19.95
Gauntlet $39.95 Switchblade II $19.95
Gordo $19.95 TOKI $29.95
Hard Drivin' $39.95 Tounrament Cyberball $19.95
Hockey $19.95 Turbo Sub $19.95
Hydra $19.95 Ultimate Chess $29.95
```

Ishido - The Way $19.95 Challenge
of Stones Viking Child $19.95
Jimmy Connors' $19.95 Warbirds $39.95

NEW JAGUAR TITLES NOW AVAILABLE!
==========

Now available for the Atari Jaguar are TOWERS II and BREAKOUT 2000!

Vince Valenti's ST hit TOWERS II is now available for the Jaguar for
just
$59.95! Available now!!

The all-time arcade classic makes its way onto the Atari Jaguar! Just
$59.95!

Also, buy an Atari Jaguar system with Wolfenstein 3D for just $59.95!!!
It's a FANTASTIC DEAL! Order TOADAY! FULL SELECTION OF OTHER JAGUAR
TITLES
AVAILABLE TOO, WITH SPECIAL PRICES GOOD THROUGH 12/23!!

AMAZINGLY HOT ST STUFF -- PRICES GOOD THROUGH 12/23/96!

This holiday, give the gift of TRUE MULTITASKING with MagiC 5, just
$99.00! Or, give what everyone's after, TRUETYPE FONT MANAGEMENT and VDI
ACCELERATION with NVDI 4!

MAGIC PC SPECIAL! THROUGH 12/23!!
Get MagiC PC for Windows 95 and run ST programs on your PC -- FAST!

It's just $169.95 -- NORMALLY $189.95 -- through 12/23!! Order TOADAY!

MAGICMAC SPECIAL! THROUGH 12/23!!
Why pay more for MagiCMac, the premier ST emulation software for the Mac!
Through 12/23 pay just $169.95 -- NORMALLY $219.00!! SAVE $50.00!! Works on Power PC and 680x0 machines! Also, get POWER PRINT for Macintosh (use any parallel printer on the Mac or with MagicMac) for just $189.00!!

IMAGECOPY 4.0CD!! JUST $49.95!!
The premier image conversion & printing program for the ST/Falcon is still
available! Also available is the ImageCopy 4.0CD upgrade for just $15.00!!

PAGESTREAM!! JUST $39.95!
PageStream, the best, valuepacked page layout & design program for the ST
is just $39.95!! ORDER YOURS TOADAY!

C-LAB FALCON SPECIAL!! THROUGH 12/23!! PRICES SO LOW, WE CAN'T PRINT THEM!
We've got C-LAB Falcon MK-X, MK-I, and MK-II machines, in 4 and 16MB configurations! If you're interested in getting a quote, please call Jennifer at (410) 544-6943! Available with and without Cubase Audio!!

C-LAB FALCON MK-X UPGRADE KITS! JUST $299!! SAVE $100!
Upgrade your Atari or C-LAB Falcon to the Falcon MK-X expandable, sleek black case for just $299! Available through 12/23 for $100 off the regular
$399 price!

ATARI HARD DISK SPECIAL!! FANTASTIC CHRISTMAS OFFER!
OUT OF THE TOAD VAULTS AND INTO YOUR HOME come these fantastic deals on these VERY CUTE, very SMALL hard disk drives for your Atari ST/TT/Falcon.
They are small, portable SCSI drives available for a LIMITED TIME ONLY! BUY NOW AND SAVE! Based on 2.5" SCSI drive mechanisms, they are fast and very reliable!

40mb.....$ 79.00
80mb.....$ 99.00
120mb.....$109.00
160mb.....$129.00
530mb.....$249.00
ICD Link II.....$ 99.00

ATARI SM147 MONITORS -- WHERE ELSE CAN YOU GET THEM?
We still have Atari SM147 14" monochrome monitors available for $199 --- all available in time for Christmas delivery. Nothing else comes close!! Great for musicians! 14" display size makes a great upgrade from the SM124! But if you want the SM124, we still have refurbished models for $99

each!

ATARI TTM195 MONITORS -- WE HAVE THEM!
If you need 19" black-and-white clarity on your Atari TT030, there's no substitute for the ATARI TTM195. We have them NEW for $250(!) and a used model for $150(!!) Get yours while they last!! Only a small quantity remaining!

ATARI STACY COMPUTERS!!
If you're looking for the portable power of the Atari STACY, we have refurbished models available for $999! Don't miss this -- this could be your last chance to get one of these classic machines!

ATARI 1040ST and 1040STE Computers!!
We have used Atari 1040ST computers available for $199 and used Atari 1040STE computers available for $299! New STE computers available too! Call for pricing! Order yours today!

HIGH DENSITY DISK DRIVE KITS!
Buy the best ST High Density disk drive kit now for just $89, including the floppy drive! FANTASTIC DEAL!

FALCON POWERUP 2! GO TO 32MHZ with your FALCON030!
Take your Falcon to new speeds for just $79!! Normally $99! SAVE NOW!!

XTRA-RAM DELUXE FOR ATARI ST!
Atari ST 2/4MB RAM UPGRADE AVAILABLE FOR JUST $49.95! NOW THROUGH 12/23/96! GET IT WITH 4 1MB SIMMS FOR JUST $99.95!! SAVE TODAY! OR GET 4 1MB ST SIMMS FOR JUST $49.95! SAVE NOW!

ATARI ST, PC & MAC BEETLE MICE! Beetle Mouse for Atari ST available now through 12/23 for just $29!! SAVE NOW, ORDER TODAY! PC Beetle Mouse PS/2 or Serial just $20, Mac Beetle Mouse just $20!!

AMAZING CD-ROM SPECIAL!! AVAILABLE NOW THROUGH 12/23!!
Get incredible prices on Atari CD-ROMs published by Toad Computers, now through 12/23/96!!

Bird of Prey.....$19.95
Atari Compendium.....$19.95
Suzy B DOUBLE CD SET.....$24.95

Or get ALL THREE for just $49.95! That's right! Just $49.95 for ALL THREE
CD'S -- this is our LOWEST PRICE EVER ON THIS SET OF EXCELLENT CD's!!

GEMULATOR 96 + MAGIC 2!! NOW THROUGH 12/23/96 JUST $99.95!!
Run your favorite ST Programs on your Windows 3.1/95 machine with GEMULATOR '96 and MagiC 2 -- the first ALL SOFTWARE Gemulator solution. Also works with Magic 4!! Call for more details!!

ATARI PORTFOLIO ACCESSORIES -- GET THEM WHILE YOU STILL CAN!! The Atari Portfolio PC Card drive allows you to read and write Portfolio memory cards using a standard PC! Now just $19.95 -- THROUGH 12/23!! ORDER

TOADAY! Also available: 64K Portfolio Memory cards -- just $9.95!! Order yours TOADAY!

SOUNDPOOL ANALOG 4/8, FDI, and other MUSIC ACCESSORIES! Available at amazing prices through 12/23! Call Jennifer at (410) 544-6943 for latest prices and to order! We also have a full line of Atari music software and
accessories available, at incredibly affordable prices!!

UNITOR MIDI/SMPTE EXPANSION UNITS BACK IN STOCK AT $349!!! Also available
are MO-4 (Midi-out 4 MIDI Expansion), Export, and others! Call Jennifer at
(410) 544-6943 for the latest prices, SPECIAL THROUGH 12/23!!

FANTASTIC ATARI JOYSTICK EXTENDERS ARE PERFECT FOR 1040/FALCON OWNERS! Tired of the silly, under-the-keyboard joystick and mouse ports on the Atari 1040ST/E/Falcon? Well, banish them forever with these simple custom
manufactured JOYSTICK EXTENDERS!! GREAT STOCKING STUFFERS! Just $4.99 each
with any order!

ATARI CX-40-LIKE JOYSTICKS FOR ATARI/COMMODORE!
Still available, these sturdy joysticks are reminiscent of the original Atari CX-40! Just $8.99 each or 2 for $12, these are a fantastic deal!!

ATARI ST CHIPS AND IC's -- AVAILABLE!!

CO25912 MMU.....$5.00
CO25914 VIDEO SHIFTER.....$5.00
CO25913 DMA CHIP.....$5.00
CO25915 GLUE CHIP.....$5.00
WDC1772 DISK CONTROLLER.....$5.00
THESE PRICES GOOD THROUGH 12/23!! CALL FOR OTHER ST PARTS!

ATARI ST MONITOR SWITCHBOXES!! SWITCH EASILY BETWEEN COLOR & MONO!
Great deal! Now switch between color & monochrome monitors, without ripping your back out!! It's just $14.95!! Price good through 12/23/96!

WARP 9 FOR ATARI ST -- NOW JUST $19.95!! PRICE GOOD THROUGH 12/23/96!
LDW POWER FOR ATARI ST -- NOW JUST $29.95!! PRICE GOOD THROUGH 12/23/96!
PRINTMASTER PLUS FOR ATARI ST -- NOW JUST $14.95! THROUGH 12/23/96!
AdSPEED ST/STE -- JUST $99!! PRICE GOOD THROUGH 12/23/96!
MEGA STE/ST/TT030 KEYBOARDS -- JUST $99.95!! PRICE GOOD THROUGH 12/23/96!
HD DRIVER v6 UPGRADE -- JUST $19.95!! PRICE GOOD THROUGH 12/23/96!
CUBASE AUDIO -- JUST $399.95!! PRICE GOOD THROUGH 12/23/96!

Order between now and 12/23/96 and receive a GOLDEN IMAGE BRUSH MOUSE free
-- just for asking!! All you have to do is ask!!

ALL THIS PLUS HUNDREDS OF OTHER ATARI ST/JAG/LYNX ITEMS IN STOCK, READY
TO
SHIP TODAY, IN TIME FOR CHRISTMAS DELIVERY!!

Ask about our great prices on PC systems, too!!

IF YOU CAN WAIT TO ORDER, YOU'LL PAY MORE IF YOU DO IT AFTER 12/23/96!!

4049. Detecting Joystick buttons

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-17 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <c117cc$f1a14.393@HERMES>
Source record: 8092

Sometime ago, I wrote a TSR which used the joystick to switch palettes based on which way the joystick is "pointed".

I recently tried to extend this into a joystick monitor (where the last X number of movements of the joystick are saved into a buffer, and can be called upon by the running ap)

Unfortunately, none of my implementations seem to be able to log the fire button.

The first time, I installed my code into the joyvec member of the IKBD structure. Whilst that will work for the standard UDLR motion of the joystick, it seems that the button is ignored (or is permanently set to "not pressed" by the time my code is run)

Next, I tried to put myself into the Keyboard ACIA data vector (using some code from a really old ST User mag). This is okay for UDLR, but when I look for any value other than UDLR, I am snookered. No fire button data seems to be available.

(In both cases, I am checking whether data bit 7 is set, signalling that the fire button is pressed)

How do I detect that the fire button is pressed, without disabling the keyboard?

(BTW: "UDLR" = "Up-Down-Left-Right")

I've never seen any rules on the parsing of the mode string but I've a
feeling "ra" is illegal as parsing is left to right. Try "ar".

>while the following code always works:
>
>strcpy(tempstring,cur_wind->filename);
>handle=fopen(tempstring,"ra");

Does it start to fail if you manually delete the file?

>anyone got any ideas why this is? is it a bug in
>lattice or something?

Assuming I've guessed right then it might be a bug or just one of the
undefined areas of C. Once a filing system error crops up it will
persist until cleared so it is perfectly possible the lattice fopen()
"mode string" parsing is doing something akin to the following where
fopen() is actually a function to test if a file of a given name can
be opened in a given mode ...

fp = fopen("foo","r"); /* fails, no file */
if OSERR == no_error THEN OSERR = status /* is EFILNF */
fp = fopen("foo","a"); /* succeeds, file created */
if OSERR == no_error THEN OSERR = status /* still EFILNF */
return (OSERR == no_error) ? fp : NULL /* oops lost the handle */

If I'm wrong then I've just typed a complete load of twaddle! :-))

If I can ever iron out the PATH problems vis-a-vis Geneva and Jetmail, I
would like to buy it and use it as my normal environment. So far, however,
I get errors when Jetmail starts - it keeps trying to look in C:\ for its
files, even though I created the GEM.CNF file as described in the Geneva
demo docs. As long asI can't get the demo to work properly with the
software I /must/ use, I don't want to spend the money for the full version.
'Twould be pointless to buy yet another program that I can't use (flashbacks
to Data Diet and the complete loss of partitions that it caused...).

> why not). Wrote a similar routine in HighSoft BASIC, which appears to
> work, but doesn't actually /do/ anything. Should I switch to
> supervisor mode before accessing the GI chip?

I think Giacces should work in user mode. Going directly to the rigisters, like in the assembly example, works only in supervisor mode.
For you info: the bit you have to change is bit #6 in register 14 of the sounchip. The MSB is bit #7, the LSB is bit #0. Bit #6 set means speaker is on (according to the profibuch). You select a soundchip register by writing the register number as a byte at adres $ff8800. You can read the contents of the selected register by reading a byte at $ff8800. You can write new data in the selected register by writing a byte at $ff8802.

Hope this information will get you a working program.

Well, to play with your rules: show me! This is type blah, blah, blah. I think it will be very hard to write a chess engine with STOS, because STOS has no functions. I think a chess program is the kind of program where data structures become handy and recursion will be used, so very bas points for STOS overhere.

Yes is the not so quick, but better answer.

> STOS Cannot do GEM
> therefore STOS is what? 90percent compatable, the only machines it
> would fall down on are Hades and Madusa types, I dont think
> complaints would come flooding in from those quarters?

Yes, I know, I don't know these people, you only know people playing games on harddisk less color systems.

> GEM made are fully compatable but can only handle board type games,
> where STOS can handle arcade AND board type games?

Gem type games are usually used as accessoire games. Games that are played when the whole system is running, busy compiling a huge C project, or compressing big amounts of data (testruns typically require 15 minutes). I know, it's different from the use of an Atari you know.

> I still feel STOS would taking the above into consideration be the
> wisest choice, The only draw back STOS has is a slight compatability
> problem with SUPER comuters, the only drawback other BASICS and C
> have is they cannot manage anything that needs speed,timing and power,
> the choice is easy :)

Ah, I see, my demo is also a demonstration of bad timing and slow code? That was omikron basic, and I know I can do it even faster in C. How do you know you can't accomplish the speed of STOS in C? Ever seriously tried to write a game in C?

With C you can do ALL: GEM games, board games, arcade games, chess games, games running on super Atari's, games that have to be fast. The only better choice is assembley. No patching is needed to support a new TOS version. A second advantage is that C is easily upgraded with new functions, either written in C or assembley (or pascal, or fortran, or Modula 2, or ....). Any function or procedure that comes in a common object format like GST or DR (digital reaserch) format can be used with most C compilers. And when necessary, you can easily mix c and assembley functions in C.

I agree, you first have to learn to program in C, and the beginning isn't as easy as it is in basic. But when you are familiar with C you can do almost anything you want, write an OS, a text processor or a game, and that game can be faster than STOS games.

Why don't you see that much C games then? Well, I think there is an easy explanation for that too: to work confortable with C you need a harddisk. And harddisks are rare in your part of the Atari world. STOS basic seems to be less power hungry and is easier to learn, so more games are produced in STOS basic in your part of the Atari world (But this doesn't mean STOS is automaticly the best game language). I havent been in the gaming world for about four years, so I don't know much about recent games. However, I do know a lot about C compilers, the Omikrom basic compiler and how to write fast screen output routines (I still like to do some demo coding so now and then). So I still think it's possible to write a better arcade game in C then in STOS basic.

Is "ra" an allowed combination? I think is't a bit strange to open a file for read and append, the proper call would be "r+" or is it a type for "rb"?

I am sory, I have no explanation for this part. Maybe you could try to put cur_wind->filename into a char* and pass that to the fopen function? Just to see what happens?

> even less under GEM!!!

So? The decision to use or not to use GEM can be made by the programmer. Being able to use GEM doesn't mean you HAVE to use GEM, but no GEM support means you can't use GEM, even if you want to. BTW: C was there at the birth of GEM.

> 2) Having to wait for GEM to load up - even worse if TOS was on disk
> :) (Non-GEM means able to be run from bootsector loader or auto-
> folder)

Still no reason not to support it. And STOS does need the OS, that's where the problems were comming from with TOS 1.04, 1.06, 2.06 etc. STOS uses a table to look up the OS routines for certain functions. On the old 520 with TOS on disk you have to load TOS before you can start something from the auto folder. At autofolder time BIOS, XBIOS and GEMDOS are installed.
The programmer has to choose which OS functions he will use:

* None means you can start the code from anywhere, you have to relocate your code and off you go. (Or it can even mean you are the OS.)
* BIOS, XBIOS and GEMDOS means you can start the program from the auto folder.
* AES and VDI can only be used when the whole system is initialized.

> 3) Booting the game on a clean system meant that compatibiltiy
> is *increased*

Meaning there are a lot of programs doing things not officially allowed for the sake of speed, but this does not mean a programming language shouldn't support 'clean' programming. A STOS game will always be incompatible because incompatibility is build into the programming language. It can be patched to work on certain TOS versions, but the incompatibility will still be there.

> What other commercial games of that time run under GEM? Not many!
> Actually, even some modern games have problems with
> GEM/accessories/etc.
> The GEM version of "nethack" which was written to run on all GEM
> machines has major problems on certain falcons reading the mouse &
> keyboard! It was written in C and still can't get 100% compatibility. I
> don't think you can ensure 100% compatibility no matter what language
> you write in.

No, because you have to cope with TOS and it's bugs. But you have a good change being compatible by using GEM. Teradesk, my favourite GEM shell, runs AFAIK on

all TOS versions and Atari like hardware. It's not a game, but it is an example of a program that is quite compatible, even First Word Plus of the stone age runs on the mordern systems I have been told.

> Look at the PC scene... most games are not designed to run under
> windows (a DOS shell in windows maybe - but then it's still under
> DOS)

Yes, in 320 x 200 in 256 colors because all higher resolutions won't work on all VGA cards, huge problems with Vesa support and secondly, PC's need a 66 MHz 486 and 8 Mb memory to do things a 8MHz 68000 with 0.5Mb memory could do ten years ago ;-).

> Even when coding in C or 680x0 I wouldn't choose to write arcade games
> in GEM - simply because it would be too slow!

I agree, going direct to the hardware is always (a lot) faster. And you can do it in C. You can do anything STOS can in C and even a lot more. That's why I think Tony is wrong claiming STOS to be the best language for games.

> Now can this thread die in peace?

No, then this newsgroup would be too silent. :-)

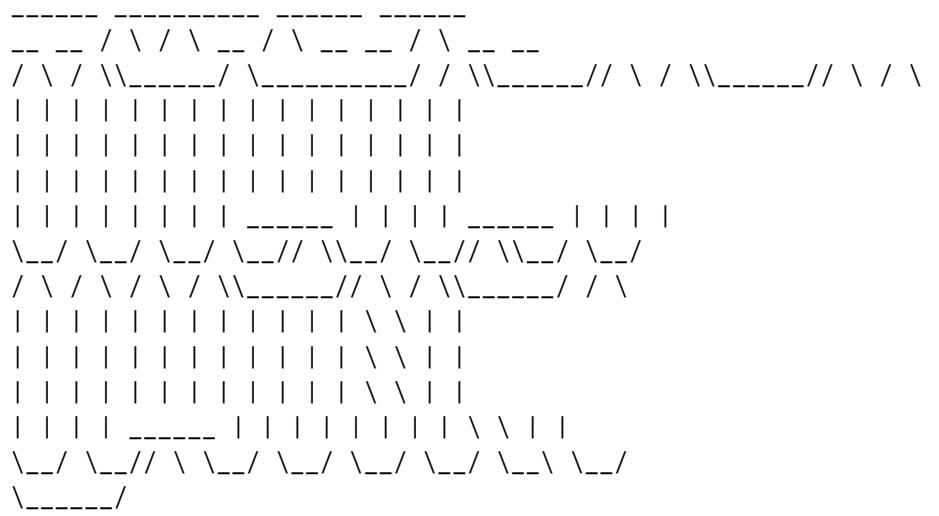
Thee Augean Stables Present:



The Atari Programmer's User Group

It's that time of the month again...

ICTARI 41 is now available on my web-page. Go to:

http://www.elis.demon.co.uk/ictari/ictari.htm

Well, the last time I posted this message, saying that Pete Hibbs is
about to step down as editor it generated exactly NO REPLIES. This is
probably his second-last issue, and there's a chance that your's trully will
take over. If your only contact with ICTARI is via my WEB-page then *please*
send an article. You don't need to be any kind of expert, just read the note
at the top of the page. I'm probably going to re-vamp the page in the new
year, with some usefull links for programmers.

Have Fun,
"Augeas"

Message-ID: <32B7B307.2781E494@etlxdmx.ericsson.se>
Source record: 8104

Hi all

I've been doing a bit of investigation into concurrent launching of programs from within other applications and would like to make a plea for a bit of cooperation from programmers.

If your program calls another program could you please test for AES >= 4 and use shel_write() mode 0 in that case rather than shel_write() mode 1. Mode 1 will only launch programs concurrently under MagiC. Under all other systems (AFAIK) it launches programs as child processes of the calling application. I appreciate Andreas' comments of a while back that this is more sensible than Atari's mode 0 approach since it works to an extent under all systems whereas mode 0 will crash most systems without AES 4. However, functionality is reduced if your user is using a multitasking system other than MagiC. A number of programs spring to mind, Thing and Kobold being the most obvious.

It's not difficult to do, I've done it for the next version of MultiPlicity so it can't be :-), and it's quite small:

If AES >= 4 then use shel_write() mode 0
else use shel_write() mode 1.

Regards
Martyn

```
g > How do I detect that the fire button is pressed, without
g > disabling the keyboard?

It would seem that the fire button does not trigger a joystick
event. Try holding down the fire button while moving the joystick
and see if you can detect that.

If true, there are only two ways to get fire button info while still
using the keyboard.

1) reprogram the IKBD (EEEEEK!)

2) periodically request a joystick report (using a timer interrupt
or VBI). You might have to switch to joystick interogation mode.

BTW, in joystick monitoring mode (which disables the keyboard), the
fire button for joystick 0 is sent in bit 6 rather than 7.

The files are the demo listings, I have the files on my HD here,
uncompressed though. For a compressed version try : [ftp]

ftp.funet.fi/pub/atari/programming
The files you want are : 1-6.zoo 7-12.zoo 13-17.zoo
which contain the whole progem package

or

if that doesn't work try the attachment....

[One or more binary attachments are retained only in the source text.]

It must be something else both of these methods should work fine. Are you sure you are using the correct structure referencer ie '->' or '.'? Are you including the correct header files for fopen you want <stdio.h>. Recheck your code, I assure you it'll be your fault and not the compilers :*)

I'm having problems with Selectric and MiNT. Selectric doesn't work
properly with MiNT sensitive programs which set Pdomain to 1 when MiNT
is installed. Filenames are shown in lower case, then, and Selectric's
mask patterns don't work anymore, even with `lower case' option
switched one.

If there isn't a solution to the problem, what's the best alternative
to Selectric?

Yes, it does. That also solves the file handle problem. I wouldn't use the term "PID", though, since that's not what it is, technically. It's a basepage pointer.

Note that you should NOT do this under MagiC, MiNT, or Geneva!

I am using Dr. Noonan's Epson Sylus driver for Pagestream. I have noticed that with very large font sizes, the driver causes lines to print across the page. I have watched closely over the past few months and what seems to be happening is that the driver only prints a short section at a time and, if the fonts are large, then it (somehow) prints the bottoms of the letters at the top of this print section.

I wish I could explain this better. But, I have seen this many times and this seems to be what is happening. Only happens with big fonts and (for example) the the very bottom edge of a 72 point size letter "A" will print two short lines above the letter that correspond with the bottom of the letter. Weird. Has anyone else seen this? Any programmers with a Stylus willing to tackle this problem (or at least try to reproduce it? I love my Stylus but I have to always work around this problem.

Oh, it is version 2.0.5 and is called STYLUS_C.PRT. Bruse Noonan unfortunately is not upgrading it further. He has moved on to other things.

Toad's prices for used ST equipment are way too high, IMO. Last week, an
Atari dealer offered me a NEW FALCON for $300 (albeit 1MB, no HD).
Compare this with the $299 "special" Toad is offering on USED STe's.
Also, a few days ago on this very group someone was selling a VERY nice TT
for $300. I think people in this group ought to write to Toad and tell
them that we are not willing to pay these prices! I know that Toad has
long supported the Atari platform, but that is not an excuse to excercise
price gouging. If you agree, write to Toad "Toaday" and let them know
their prices are way off. I think the Atari community will be better off
with realistic prices set for equipment.

Yes, but it requires a 68881 coprocessor ;-)

You could also try writing C code then looking at the results with a
debugger (I do that a lot with Pure C).

I've not done anything with joysticks so all I can do is quote a
section which might be relevent.

[from page 341, Compute Tech Ref Vol 3, ISBN 0-87455-149-8] ...

"After any joystick command the IKBD reads both ports as if they have
joysticks attached with one of the buttons assigned to each. After any
mouse command (except mouse disable $12) the IKBD scans port 0 as if a
mouse were attached and "steals" the joystick 1 fire button line for
the right mouse button. In this condition the only way to read the
fire button on joystick 1 is to temporarily disable the mouse with
command $12. Then, the fire button on joystick 1 can be read until the
mouse is enabled again."

The above book has 30+ pages dedicated to the IKBD if you can find a copy.

>both easier and quicker. Thoughts?

Wireframes will certainly be quicker but even the blitterless ST can
drag a window plus its contents at a reasonable speed.

I've never had the need to fiddle with trap2 but it should be
possible. There are three possibilities I think ...

a) Find a portable way of using the AES vdi handle and pretend to
be the desktop. Without docs on the matter you may interfere
with settings the desktop has in effect. The problem of
implementing vdi calls within the trap is entirely yours of

course!

b) Use the LineA. This will not affect the vdi at all due to the
necessity of having to rewrite all variables for all calls (ie
the vdi has to do this also). However, the linea should not
really be used and use of it will almost certainly fail under
some non standard situations (extended screen driver etc)
where linea may not even exist.

c) Limit the feature to your own programs.

Another less obvious problem: you would have to ensure a multitasking
system does not taskswitch midway through your code else the screen
would be corrupted. This alone may limit you to (c) unless you can
find a portable way of locking and unlocking the screen manager.

Hi John,

I just wrote a key boardhandler, maybe it will help you a bit. The problem is this is just a level closer to the machine as you want do do your stuff, because I install myself in the ikbdsys vector and your joystick toutine has to work in the joyvec vector, but according to my documentation the information you want is pointed at by A0.

The programming language is C.

Bye, Hans Wessels

```
---------------------------->8-----------------------------------------------

I suspect they're trying to liquidate their remaining inventory without
too much of a loss. Now that they're in the PC business, all that old
ST equipment is taking up room and costing money to store, heat, and
air-condition. If you mention prices, they'll probably come down.

I thought STeve Kipker's STeve's Atari Sales was the last Atari-only
bastion, but even STeve has been forced to go Macintosh. But he hasn't
made the intimations that he is dropping TOS support (like Toad has).

Hmm... I'm fairly sure that the a stands for 'ascii' not 'append' (I wrote
the original code with the lattice manuals in front of me. I wrote the
above code the day after from memory...) [ascii forces the conversions,
which I guess is probably the same as 'r', but its more obvious that it
isn't reading as binary]

We set our prices based on two basic principles: supply and demand. In our experience the prices on that equipment are agreeable to the people who buy it, hence their inclination to purchase.

With all due respect if you would like us to lower our prices, you will need to either increase supply or decrease demand. :)

"Ambassador ," asked Steven. "Do you really want to know what's going on down
there right now?"
"Yes, absolutely," replied gary@the-gap.demon.co.uk.
Steven moved forward, and whispered something.
g>

g> I'm very confused and I've looked at the MagiC5 documents.

Mode SHW_PARALLEL I believe.

g> How can I launch a program (say CAB) from another program, AND leave
g> the original program running?
g>
g> Magic5 doesn't support Pexec (load,go,don't wait).

I thought it did? Hmm lets take a look.

[fx: takes a look at MagiC docs]

Nope it appears not.

g> Magic5 doesn't 'seem' to support mode 0 of shel_write.

No, it doesn't.

g> Mode1 is no good because it doesn't launch the program until the
g> calling program has exited. :(

Which is what is meant to do.

g> Help!!! Does anyone have any idea how I can do this?

I think its shel_write(SHW_PARALLEL) #100, its detailed in one of the files
in the magic 5 programming docs archive.

g> I'm not interested in sharing memory or any of that stuff. Just a
g> straightforward start another program.

4084. <Q> Falcon Audio

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-20 00:00:00 UTC
From: mark@mdsh.com
Message-ID: <32bbe2ec.4315103@news.idiscover.co.uk>
Source record: 8127

Has anyone got any information on bit 6 of $ffff8930 on the Falcon.

The only information I have is that it's set to zero (as below) but the
audio app I'm working on at the moment (a new version of PlayAIFF) only
works with bit six set.

$FFFF8930 [R/W] :$01 76543210 .... Sound-Source-Device-Prescale-Mode Hi

```
||||||||
||||||||  Source-Device: EXT-INP
|||||||+----  1: Handshaking off
|||||++-----  Source-Clock
||||+-------  set to zero
||||
||||  Source-Device: A/D-Converter
|||+--------  set to zero
||+---------  0: internal 25.175 MHz-Clock
||  1: extermal Clock
++----------  set to zero
```

Thanks, in advance.

4085. Falcon and BlowUp FX

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-20 00:00:00 UTC
From: gaghon@nevada.edu
Message-ID: <59ct55$37o@news.nevada.edu>
Source record: 8128

Can anyone give me any information about the BlowUP FX.
We want to expand the Falcon. We also have several 1meg 30pin simms
lying around. With the BlowUp FX, can you use those one meg simms
to expand to 8megs? also, how much does it cost, is it hard to install
(I have some soldering experience).

Thanks,

George

I don't see why more dealers could not offer support for multiple
platforms like this. I totally understand that it's near impossible
to make a business stay afloat on Atari sales alone, but to carry it
as a side would seem to be a viable solution.

John.Kormylo@7861.conchbbs.com (John Kormylo) said:-

>Hmmmm, would it work to insert the ACC's PID into *(_syshdr->_run)
>before calling Malloc() then re-insert the application's PID?

Yes but it's not portable. It will only work under standard Gem and
there's no guarantee it will work with a future version. MagiC for
instance, allows you to Malloc() as and when you please because it
treats accs like apps and switches appropriately.

```
d > Yes, it does. That also solves the file handle problem. I
d > wouldn't use the term "PID", though, since that's not what it
d > is, technically. It's a basepage pointer.

d> Note that you should NOT do this under MagiC, MiNT, or Geneva!

I planned to test the original value of *(_syshdr->_run) to see if
it matched the ACC's BPA. (You have to read it anyway in order to
restore it later.) I assume under a multitasking OS the two will be
the same (when you read it), in which case you don't need to mess
with it.

BTW, I think I picked up using "PID" for the basepage address from
the MPB documentation, or maybe it was MiNT.

I thought about releasing source code for a bunch of ACCalloc() etc.
functions, but would rather make them Pure C specific assembly code
so as to avoid calling the Malloc() etc. interface functions.

Anyway, I need to fix RAM_HOG.ACC

To start programming something I have never attempted before? to make
a point? eeerm I think not :)

>it will be very hard to write a chess engine with STOS, because STOS has no

Yes you are right, it would be very very hard I presume, but still
possible, I realy don't see why not?

> > therefore STOS is what? 90percent compatable, the only machines it
> > would fall down on are Hades and Madusa types, I dont think
> > complaints would come flooding in from those quarters?

>Yes, I know, I don't know these people, you only know people playing games on
>harddisk less color systems.

The point being made is that the vast majority of game playing ATARI
owners will have access to ATARI ST Low? ,
I don't see this as much of a disputable point, do you ?

>Gem type games are usually used as accessoire games. Games that are played when
>the whole system is running, busy compiling a huge C project, or compressing big
>amounts of data (testruns typically require 15 minutes). I know, it's different
>from the use of an Atari you know.

Yes you are correct, multitasking of any description is something I
can only do with two machines running, however I think you are
stretching the point a little,
Scenario: You know BASIC and you know C, you NOW! want to make a game
for the ATARI, do you attempt a gem game that would be a little bland
but works as a desk ACC and is pretty compatable?, or do you go all
out to make a game that people will be attracted to? , you can only do
so much with a desk acc, and most of this has already been done yes?
and the thread is the best BASIC for making a game today!

> > problem with SUPER comuters, the only drawback other BASICS and C
> > have is they cannot manage anything that needs speed,timing and power,
> > the choice is easy :)

>Ah, I see, my demo is also a demonstration of bad timing and slow code? That

Your demo is just that, a demo, NOT a game, alright you will say it
can be changed into a game, I doubt that very much, the only part that
looks like a game is the menu, and sorry but even that does not
function very well does it, so if it doesent even work as a good menu,
what chance a full game ?

>was omikron basic, and I know I can do it even faster in C. How do you know you
>can't accomplish the speed of STOS in C? Ever seriously tried to write a game in
>C?

aha!!!!!!! you are now getting to the point :), I am a STOS coder,
YOU are the C coder, I have shown you mine, it is up to you to show me
yours!, it is not up to me to show you how fast C is, I can write
nothing in C, what do you think this thread is far, it is for me to
say STOS is best, you prove me wrong, not me prove me wrong <smile>

>With C you can do ALL: GEM games, board games, arcade games, chess games, games

I do not dispute any of the above, but if you could use C and BASIC
and STOS BASIC, then STOS would IMHO and many others? be the best
choice today to attempt to make a game,

>running on super Atari's, games that have to be fast. The only better choice is
>assembley. No patching is needed to support a new TOS version. A second

I do not dispute that, but we are not talking about best language,
thats for others to squabble over, I am talking about someone
attempting to make a game today, with the choice of BASIC or C,

>advantage is that C is easily upgraded with new functions, either written in C
>or assembley (or pascal, or fortran, or Modula 2, or ....). Any function or

Yes I know, but that is not proof that it is good for games?

>procedure that comes in a common object format like GST or DR (digital reaserch)
>format can be used with most C compilers. And when necessary, you can easily mix
>c and assembley functions in C.

so? still doesn't win any debates does it?

>I agree, you first have to learn to program in C, and the beginning isn't as
>easy as it is in basic. But when you are familiar with C you can do almost
>anything you want, write an OS, a text processor or a game, and that game can be
>faster than STOS games.

yawn......the point is, would anyone?, thats the thread, thats the
question,

>like to do some demo coding so now and then). So I still think it's possible to
>write a better arcade game in C then in STOS basic.

Want to put it to the test ?

>BTW Tony: who is stario land and why does it, well, you know...

hmmm don't know where you got this from :), but it is true, I have a
very LOW estimation of STARIOLAND, I took one look at this slooow
boring and very bland platform game, took one look at the 20ukp price
tag and thought hey!, I can do better for free :))), ten years ago ok,
but chrging such a high price in the current market for such a drab
game is a bit of a *** *** IMHO :)
hmmm this does beg the question what it is written in ?

> obvious that it isn't reading as binary]

I checked the Lattice C (5.0) manual for it, and I must admid, the description overthere is a bit fuzzy, but K&R (2nd edition) page 242 is quite clear:
"r" open texstfile for reading
"w" create textfile for writing
"a" append, open or create a textfile to write at the end
"r+" open textfile for update (read and write)
"w+" create textfile for update, delete the existing one
"a+" appen, open or create a textfile for update, with writing at the end

When a 'b' folows after ony of the above symbols the file will be handled as a binairy file.

So a file is always opened as an ascii file unless 'b' is used to force it into a binairy file.

Linux/m68k doesn't require a built-in MMU, just a m68k processor with
an MMU; a 020+8851 will work.

The original poster should note, however, the wording of the FAQ
(namely "There is *no way* to run it without one"); i.e. there is no
way around this. You need a better processor than a 68000.

From the Linux/m68k FAQ[1] :-

"2.1 Processor

You need a Motorola 680x0 processor *with PMMU*. There is *no way* to
run it without one. This reduces the list of possible processors to
68020+68851, 68030, 68040, 68LC040, 68060."

>
> Want to put it to the test ?

Yes, I have almost finished the conversion of Heartland to C. The screen is moving, the sprite works (still have trouble with the right sequence of sprites when rotating the sprrite clockwise and anti clockwise). It doesn't have any of the card- and teleport animations but I think that isn't essential for the game play, and the prove the game game be done better and faster in C.

But:
* It's faster than STOS basic, my C version has a playfield of 160 scanlines instead of the 128 you do with STOS basic.
* It will work on ST, Ste, TT and Falcon
* It has IMHO better sprite handling routines, it won't fall down from a platform that quick.
* It will work on a machine with 512kb or more memory
* It will play chip music on an ST and DMA music on STe and better
* Support of cursor joystick, normal joystick and joypad
* On fast machines (like TT and Falcon) the game will switch to 1VBL mode and scroll on nibble level.
* It is fully synced, so on accelerated ST's it will always run in 2 vbls, no matter how fast your ST is. But you can switch to the fast machine mode by pressing a key.
* The whole game is writen in C, according to the rules.

The game is also faster, more compatible and better timed...

To say it in chess terms check! mmmmma... :-)

Still have a question...

As the whole game design is yours I can't release the game in the public domain. So I donate it to you. You can release the game if you want (as heartland 2.0 or something like that). If you want to release the game as heartland 2.0 we have to spend some time making the game like yours, including card animations and teleport effects, game loading and saving and so on. If you don't want to release the game I simply send you a finished version without save routine and intro picture nad so on.

So, what are we going to do with the game? (I think will have it finished it tuesday).

A bugg report of your game (it's in mine too):
If you go to the most right part of the game map and from there up, to the point where you can go back to the rest of the game you will come to a point you can jump up into a wall, it looks something like this:

```
X
X < wall
platform X
==================X
X
X
X platform S < sprite
X====================================
```

When you continue to jump up in the wall the game will crash.

Further I still haven't found out how to reach the three coins close to the boy image in the wall, right of the big slide and those coins located high in the game map (these are the same a I asked you about some time ago).

>
>> BTW Tony: who is stario land and why does it, well, you know...
>
> hmmm don't know where you got this from :), but it is true, I have a

I wrote this when I just had the routines for displaying the map working.

>Hi there, all of you, the thread is going to end...
>It's 11 days before the end of 1996. So time is almost over.

And me being ME will then state STOS is the best BASIC for making games in 1997, and all the members of the knitting classes who lurk in here will have releative Heart attacks :))

> > for the ATARI, do you attempt a gem game that would be a little bland
> > but works as a desk ACC and is pretty compatable?, or do you go all
> > out to make a game that people will be attracted to?

>I will do a blazing fast non GEM game, requiering ST LOW.

But you went to great lengths telling us all how some ATARI computers cannot use ST Low thus making any game that does not support other resolutions inferior, you seemed to be saying that so long as it worked on every machine then it was the best, hmm even if the game was naff?

> > YOU are the C coder, I have shown you mine, it is up to you to show

>OK, I will :-)

eh?...you will hehehehe

> > say STOS is best, you prove me wrong, not me prove me wrong <smile>

>You think heartland is the best you can do in STOS (given the game type?)?

NO, thats a BIG NOOOO, not only is it not the best STOS can do, but there are other STOS programmers around,
I am currently loking at making a game that will have same scrolling etc, but plenty of independant baddies, that will be uncontrolled, ie: no set left/right paths, also a still background screen, then when the platforms move it gives a spooky parralax effect , and a few other ideas,
However I must stress that these are as yet only working individual routines, yet to be all plonked into a game <?> yikes :)

>Well, the choice to get the best, and fastest game is C!

So you keep saying?

> > Yes I know, but that is not proof that it is good for games?

>No, it is not.

hmm your being agreeable...I sense a trap ;-)

> >> game, and that game can be faster than STOS games.

> > yawn......the point is, would anyone?, thats the thread, thats the
> > question,

>Yes, I will!

You will? oooer

> > Want to put it to the test ?

>Yes, I have almost finished the conversion of Heartland to C. The screen is

You sneaky devil you :)

>moving, the sprite works (still have trouble with the right sequence of sprites
>when rotating the sprrite clockwise and anti clockwise). It doesn't have any of
>the card- and teleport animations but I think that isn't essential for the game
>play, and the prove the game game be done better and faster in C.

heres a point?, waddaya mean "faster", if you mean more proc time
left then put something else in and then it will be better,

>* It's faster than STOS basic, my C version has a playfield of 160 scanlines
>instead of the 128 you do with STOS basic.

I doubt a game player would notice, I set the heartland screen out in
such a way that it hopefully gave the illusion that it started from
the top of the screen, not to a fellow programmer, but to a game
player, and most people at first glance, you would not know that there
is unused screen at the top,its an illusion and I know for a fact that
it works to a certain extent, believe me the screen was not simply
thrown together, a lot of thought went into it

>* It will work on ST, Ste, TT and Falcon

Ok TT would beat me, but thats IF you manage it, so far yours works
on NOTHING yet ?

>* It has IMHO better sprite handling routines, it won't fall down from a
>platform that quick.

hehehe, alright I was sloow but I figured out the part you where
attacking, you originaly gave the impresion that the sprite hung over
the edges of platforms, or fell through platforms, (IT DOES NEITHER)
but what it does do is scroll the screen at 8 pixels, but for simple
sprite detection I force two moves, thus only having to do 16pixels
sprite detection, as the play area is made up of 16x16 bloacks then
all i have to do is keep track of which block is where?
changing two variable and you can have the same game moving at 4,2 or
1 pixels,
for example if you set to one pixel scrolling, then you move left,
the screen will move one pixel, but will move 16 times before you get
control again,

this is far less noticable at 8 pixels, and its only a programmer
examining the game that would notice, believe me no one else has ?

>* It will work on a machine with 512kb or more memory

NO!!! NOT IF YOU PUT EVERYTHING IN, you said you left half the game
out because it was not needed to prove the speed point, if you had put
it all in then you either have a lot of disk access, or you go over
half a meg, that was a little cheeky of you to try and sneak "half
meg" in, you could not make the SAME game in half a meg, noooooo way,
the falcon sample is over quarter of a meg for a start!!
If I was to take most of the stuff out like you have then I could do
half meg,

>* It will play chip music on an ST and DMA music on STe and better

Mine already does that, but even more enhanced sound if ste has more
than one meg or a falcon is detected,

>* Support of cursor joystick, normal joystick and joypad

I can do jagpad easilly enough, just didnt, actually its very simply
to implement,

>* On fast machines (like TT and Falcon) the game will switch to 1VBL mode and
>scroll on nibble level.

Yeagh, ? I will be impressed, if I see it :)

>* It is fully synced, so on accelerated ST's it will always run in 2 vbls, no
>matter how fast your ST is. But you can switch to the fast machine mode by
>pressing a key.
>* The whole game is writen in C, according to the rules.

eeerm there wernt any rules, wish I knew we where having a compo, I
could have set to something C would be impossible to do,

Would like to see C make VidIgrid 2 hahahahaha

>The game is also faster, more compatible and better timed...

In Your Opinion....

>To say it in chess terms check! mmmmma... :-)

Hmmmm I think my King is safe, I cant even see your set? <smile>

will yours have the sprite walking behind all the objects mine does,
to be honest that was the killer punch in my game and the effect takes
half the proc time :(
I presume your game will be as big and have the animations, will it
have as much animation as diamond ice has?

I don't doubt your programming abilities Hans, but will be suprised
if you can duplicate Heartland in C, let alone the enhancements found
in diamond ice,

>Still have a question...

>As the whole game design is yours I can't release the game in the public
>domain. So I donate it to you. You can release the game if you want (as

No you should release it, the work will be yours and the public whome
the majority are FM and STe owners, can play the games side by side
and see which is best:)

>heartland 2.0 or something like that). If you want to release the game as
>heartland 2.0 we have to spend some time making the game like yours, including

a unproductive task, no point having two of the same other than to
compare,

>card animations and teleport effects, game loading and saving and so on. If you
>don't want to release the game I simply send you a finished version without save
>routine and intro picture nad so on.

as the work is yours then the decision is yours, I wont mind :)

>So, what are we going to do with the game? (I think will have it finished it
>tuesday).

if it is anywhere as good as mine from a gameplayers point of view
then I will eat my words :)
although we would probably both have to show the actual source to
prove to anyone interested that only BASIC commands or only C commands
where used :)

>A bugg report of your game (it's in mine too):
>If you go to the most right part of the game map and from there up, to the
>point where you can go back to the rest of the game you will come to a point you
>can jump up into a wall, it looks something like this:

thats the design of the map, not the actual engine, no detection is
done in mine for what is above the sprite, the map was supposed to be
designed so the sprite could not reach anything above it that it
shouldnt,, obviously one part was designed wrong,

>Further I still haven't found out how to reach the three coins close to the boy
>image in the wall, right of the big slide and those coins located high in the
>game map (these are the same a I asked you about some time ago).

Red Herring!, the sprite is there to attract, let you notice, a
simple look at the map should show that its impossible to get to them,

NO its not a bug :), its a nasty bit of game play to make you work :)

When I released SPOT IT, I knew it was hard, so I made it quite clear
there was a cheat, loads of people wrote asking where the cheat was as
they had tried everything to find it and couldn't, well there was NO
cheat, but trying to find it added to the game :)

no one said you could get all the coins :)

The ones at the top? well if i recall, you have to go through one of
the doors and you are transported there? I think ?

Cheers.............!ynoT

That's nice, but I realy believe the honours will have to go to C. So will
still have a lot of debating to do. :-)

> But you went to great lengths telling us all how some ATARI computers
> cannot use ST Low thus making any game that does not support other
> resolutions inferior, you seemed to be saying that so long as it
> worked on every machine then it was the best, hmm even if the game
> was naff?

No, I was telling you a programming language wasn't the best if it couldn't do
all types of games for all types of computers. You don't dispute the fact that C
can do GEM type of games. You do dispute if C can do fast arcade type of games
like you do in STOS, so if I can prove you wrong too on that point, there is
nothing left for STOS to be better at.

>> Yes, I have almost finished the conversion of Heartland to C. The

I am using the processor time left to display 32 lines of display extra.

> that it works to a certain extent, believe me the screen was not
> simply thrown together, a lot of thought went into it

I think they will notice. Game players aren't THAT stupid. For me it's simply a part of showing C is faster than STOS.

>> * It will work on ST, Ste, TT and Falcon
>
> Ok TT would beat me, but thats IF you manage it, so far yours works
> on NOTHING yet ?

It works on my two Atari's. (1Mb TOS 1.0 and a 4Mb Kaos TOS). But working on a TT is simply a matter of starting the game on a TT. I don't expect any trouble there.

>> * It has IMHO better sprite handling routines, it won't fall down from

So I beat you there to, when you are on nibble scroll you can position your sprite on 4 pixels exactly, in byte scroll on 8 pixels. Further the sprite is nicly alinged with the field grid.

> this is far less noticable at 8 pixels, and its only a programmer
> examining the game that would notice, believe me no one else has ?

Or no one cared to complaim, all being happy to get a new game for their ST?

>> * It will work on a machine with 512kb or more memory

> way, the falcon sample is over quarter of a meg for a start!!

So? There are no falcons with half a meg. I will only load data I really need on the machine, and will only preshift sprites that are really needed. I can do the complete game in half a meg. It's simply a matter of allocating the memory you need and loading the data you need. More memory will be allocated when there is enhough memory and when it is needed for extra effects.

>> * It will play chip music on an ST and DMA music on STe and better
>
> Mine already does that, but even more enhanced sound if ste has more
> than one meg or a falcon is detected,

Your game doesn't play chip music. It only does when you hit upon a coin or touch a spike (and things like that). At that moment game speed will slow down to 3 vbls (talking about good timing here?). I can play chipmusic all the time an will still have a 2 vbl game.

I will have to look for the extra STe and Falcon smaples. Up till now I only found one. (Thinking there was only one.)

>> * Support of cursor joystick, normal joystick and joypad
>
> I can do jagpad easilly enough, just didnt, actually its very simply
> to implement,

Maybe you didn't because detecting joystick, cursor youstick and joypad costs too much time?

>> * On fast machines (like TT and Falcon) the game will switch to 1VBL
>> mode and scroll on nibble level.
>
> Yeagh, ? I will be impressed, if I see it :)

Will, quite simple, if the game runs in 2 vbls on an ST than it will run in 1 vbl or less on a comuter with a bus and processor twice as fast. The nibble scrolling will work because I tested it on my computer (still running in 2 vbls though).

>> * The whole game is writen in C, according to the rules.
>
> eeerm there wernt any rules, wish I knew we where having a compo, I
> could have set to something C would be impossible to do,

The rules are no assembley. If I was allowed to use assembly I could to the game full screen (I think, didn't check that out).

> Would like to see C make VidIgrid 2 hahahahaha

What's VidIgrid 2? Does it run on my ST?

>> The game is also faster, more compatible and better timed...
>
> In Your Opinion....

Why, it's clear, I am doing more lines in the same time, so the code has to be faster. It's better timed because the code is synced every vbl.

> will yours have the sprite walking behind all the objects mine does,
> to be honest that was the killer punch in my game and the effect
> takes half the proc time :(

Ofcourse, no problem on that point, it looks exactly like your game does, there is more to see, you have a better sprite control, but all animated sprites are

there, the sprite will walk behind all objects like it does in your game. It's all the same, only a bit better. :-)

> I presume your game will be as big and have the animations, will it
> have as much animation as diamond ice has?

Sorry, haven't seen diamond ice, but my game has actually more animation than your Heartland, because the viewscreen is bigger, so there is more animation to be seen at the same time.

> I don't doubt your programming abilities Hans, but will be suprised
> if you can duplicate Heartland in C, let alone the enhancements found
> in diamond ice,

Heartland was no problem for C. I still have 2 lines of 20 16x16 sprites to spare before I am back on the same level as you, so I have some time left to do some extra animations if you like.

> No you should release it, the work will be yours and the public whome
> the majority are FM and STe owners, can play the games side by side
> and see which is best:)

Ok, that's nice.

> a unproductive task, no point having two of the same other than to
> compare,

They aren't the same, Heartland 2.0 is better, works on more machines, has an improved playing area. So there won't be two of the same, but the old version and the new improved version.

>> So, what are we going to do with the game? (I think will have it
>> finished it tuesday).
>
> if it is anywhere as good as mine from a gameplayers point of view

Well, you have to test it, but I think you will have to agree it's better.

> although we would probably both have to show the actual source to
> prove to anyone interested that only BASIC commands or only C
> commands where used :)

I have no problem releasing the C code.

>
>> A bugg report of your game (it's in mine too):

Yes, that's a programmers view. To an ordinary player is't a bug in the program because the computer suddenly terminates the execution of the game and goes back to the desktop without enabeling the mouse again.

>> Further I still haven't found out how to reach the three coins close

So it's also impossible to get more than 3000 points? Just because you can't bear the thought someone is above you in the highscore list?

> no one said you could get all the coins :)
>

None of them does so (if I recall it right).

> "rb"?

"ra" doesn't mean open for read and append it means open for read in Mode A.
Which means the file is read only and ASCII translation will take place.
The call is perfectly valid.

Does STOS allow you to use the VDI? If it did then compatability across systems could be improved greatly, however its use in arcade games would be restricted.

>I know I have used before...
There's nothing wrong with "ra", it means "read in ASCII mode" whereas "rb"
is "read in binary mode". "ar" wouldn't work and isn't what you want.

Try making your filename static char[].

```
/* ****************************************************************
void ACCset(void);
void ACCreset(void);

There are certain functions which should not be called from an
accessory (after AES has been initialized):

Malloc(), Mxalloc(), Mfree(), Mshrink(), Fcreate(), Fopen(),
Fclose() or any stdlib function which uses these GEMDOS functions.

The reason is that single-tasking TOS will assign the resulting RAM
or files to the application, rather than the accessory, and will
free/close them when the application terminates.

This problem can be solved by bracketing the function call with the
ACCset() - ACCreset() functions:

ACCset();
p = Malloc(size);
ACCreset();

If you call ACCset(), you MUST call ACCreset() before the next AES
call. Do NOT call ACCreset() before ACCset() has been called.

Designed for Pure C only.

No, "ra" not a perfectly valid mode string. K&R edition 2, knows only the modifier 'b' for binairy mode. The modifier 'a' for ASCII mode does not exist. It's something of Lattice C only I think, because it is in the Lattice C manual, but it's not in K&R 2 nor in Pure C. I tried to open a file with "ra" in pure C and it didn't work.

There is no need for the 'a' modifier to read in ASCII mode, because without a modifier a fopen() will always open a file in ASCII mode. There is also ModeA, ModeB and default in the ANSI C standard. Default is ASCII and for binaire mode you have to use the 'b' modifier. So don't use the 'a' modifier in fopen if you want your C source to be compatible. (The integer _fmode doesn't exist too in ANSI C.)

You are quite right Mr Greenwood, STOS is the best BASIC on the Atari
for making games. I would argue that it has been since it's creation.

>That's nice, but I realy believe the honours will have to go to C. So will
>still have a lot of debating to do. :-)

How can C be the best BASIC ;)

> > But you went to great lengths telling us all how some ATARI computers

> > resolutions inferior, you seemed to be saying that so long as it
> > worked on every machine then it was the best, hmm even if the game
> > was naff?

Surely this is a restriction in the hardware, not the software? Atari's
incompentance at making a non-fully compatible machine.

>No, I was telling you a programming language wasn't the best if it couldn't do
>all types of games for all types of computers. You don't dispute the fact that C
>can do GEM type of games. You do dispute if C can do fast arcade type of games
>like you do in STOS, so if I can prove you wrong too on that point, there is
>nothing left for STOS to be better at.

Erm... not being funny but I have yet to see a good GEM game, IMHO. I
feel it is easier to write a game in STOS then C. There are some STOS
commands which are so darned high level the programmer need do an
absolute minimum! I appreciate, however, that in C you can use libraries
which in effect offer high level programming.

>I think they will notice. Game players aren't THAT stupid. For me it's simply a
>part of showing C is faster than STOS.

Oh, a sweeping comment !!

>So? There are no falcons with half a meg. I will only load data I really need
>on the machine, and will only preshift sprites that are really needed. I can do
>the complete game in half a meg. It's simply a matter of allocating the memory
>you need and loading the data you need. More memory will be allocated when there
>is enhough memory and when it is needed for extra effects.

Go on then... do it ;)

>Maybe you didn't because detecting joystick, cursor youstick and joypad costs
>too much time?

The time, in STOS for joypad detection, is not noticeable.

> > Would like to see C make VidIgrid 2 hahahahaha

>What's VidIgrid 2? Does it run on my ST?

Oh boy, have you only a minimal connection with the Atari scene or
something? What's Vidigrid 2?? Hehehe, LOL!

>Why, it's clear, I am doing more lines in the same time, so the code has to be
>faster. It's better timed because the code is synced every vbl.

Whether is is faster in vbl's is irrelevant.. it is the playing that
matters. Maybe it will be too fast and impossible to control?

>Sorry, haven't seen diamond ice, but my game has actually more animation than
>your Heartland, because the viewscreen is bigger, so there is more animation to
>be seen at the same time.
Have not seen Diamond Ice? Where ya been!!!

> > a unproductive task, no point having two of the same other than to
> > compare,

>They aren't the same, Heartland 2.0 is better, works on more machines, has an
>improved playing area. So there won't be two of the same, but the old version
>and the new improved version.

In your opinion.. we'll have to see to compare..

>Well, you have to test it, but I think you will have to agree it's better.

> > although we would probably both have to show the actual source to
> > prove to anyone interested that only BASIC commands or only C
> > commands where used :)

>I have no problem releasing the C code.

BTW, don't you have a day job or something?! If only I could get time to
write a program just to see if it was faster than another!!

>So it's also impossible to get more than 3000 points? Just because you can't
>bear the thought someone is above you in the highscore list?

Oooh, handbags!!

I only joined this thread to see if I could be number 100 in it!!!! Like
I care about this arguement ;)

We all know that C and STOS are very different, STOS is better at games
and C is good for GEM applications. Real programmers use assembler...

In and out of this thread!!

Merry Christmas

I've looked at Toad's website. Yes, the prices are higher than you can get from a second-hand shop or a direct used sale. That's the nature of being a dealership--on used equipment sales, you can't compete with what somebody just dumping a machine will ask. Somebody just dumping a machine can't take your credit card and be a legal entity you can take recourse against if there's a major problem, either.

As for your statement about supply and demand, you can apply it to them just fine. Don't demand their machines and you're applying it. What's the problem there?

Nobody's asking you to be benevolent. If you think Toad's prices are too high there are other places to get the machines from. They're setting their margins, other people have their own. Personally, I think they're too high for me, so I'm counting on a sales post here to come through. But others may disagree.

Are you sure of this? It is certainly not true for K&R where there is
no way of explicitly defining ascii mode - it just defaults to it and
"a" does mean append. I'm beginning to wonder if ANSI rules are
different?

>>feeling "ra" is illegal as parsing is left to right. Try "ar".
>
>aahh... thats possible... hmm.. except 'ra' is simular to 'rb' which
>I know I have used before...

There may be a K&R/ANSI incompatability issue here - again I can't be
certain. Here's the K&R version from my MWC manual which tends to
pride itself on being exact past the point of comprehension (you
should see its description of strtok())!! Back to the point ...

r read ascii, error if not found.
rb ditto binary
w write ascii, truncate if found, create if not found.
wb ditto binary
a append ascii, no truncation, create if not found.
ab ditto binary.
rw read/write ascii, no truncation, error if not found.
rwb ditto binary.
wr write/read ascii, truncate if found, create if not found.
wrb ditto binary.
ar append/read ascii, no truncation, create if not found.
arb ditto binary.

r+ rw
w+ wr
a+ ar

"ra" equates to "r+" equates to "rw", and "rw" is the reason I think
Lattice may have a bug. It should consistently fail _unless_ ANSI
states differently. ;-)

>>>while the following code always works:
>>>
>>>strcpy(tempstring,cur_wind->filename);
>>>handle=fopen(tempstring,"ra");
>>
>>Does it start to fail if you manually delete the file?

>

>It does sound as if it is possibly correct... I'll give it a try. :)

I'd be interested to hear what you discover on this - bug or ansi
feature.

The accessory will be the "active" process until it makes its first
aes call (under standard gem) after which it may or may not be (it
isn't but you can't be sure).

>I assume under a multitasking OS the two will be
>the same (when you read it), in which case you don't need to mess
>with it.

There is no guarantee (but it does seem to be) that what you have just
read in the os header is anything at all under anything but standard
gem. It would probably be best to look for specific operating system
cookies?

TOS versions less than 1.4 do not have the information in the os
header. You have to know the address where the basepage for the active
process is stored. It is $602C for all versions except the spanish one
which is $873C.

4113. Loading Extensions

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-25 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <c197cc$1730b.357@HERMES>
Source record: 8056

I've been working on a TSR that allows you to plug in extensions at boot time.

These extensions allow you to have one system-wide piece of code to (for example) translate bitmap graphics, edit on-disc data, and so forth.

So, the bitmap translator will be one library, the disc editor will be another, and so forth. And each library will reside in different executable files loaded at boot time.

Now, before I finalise things, I am interested to find out : what info would an extension need to know about at boot time? I already pass it info about the version of the TSR it will be plugging into, the CPU, FPU of the machine it is running on, TOS version, and which extensions are already loaded.

Before loading it, I have also checked that the extension has the correct magic id (so that I know it is an extension and not just a misplaced regular app), that it has a unique "cookie" and id number, and that CPU, FPU, and TOS are appropriate.

Is there anything obvious that I have forgotten to check for prior to extension loading time? Or to pass to the extension when it is loaded?

Oh, and while I am at it - if I happen to come across a second copy of an extension while loading, what should I do? My idea is to implement a "newer-is-better" policy, whereby the older version is "forgotten" and the newer version replaces it.

Your ideas, advice, guidance is welcomed.

Hans Wessels:
> When a 'b' folows after ony of the above symbols the file will be
> handled as a
> binairy file.

The attributes the file is opened for (ie either read,write or append) is
always the first letter in the string and the mode always the second for
example:

"a" - Append in default mode.
"a+" - Append and read in default mode.
"ra" - Read in ascii mode.
"aa" - Append in ascii mode.
"aa+" - Append and read in ascii mode.
"ab" - Append in binary mode.

There are other combinations but you get the picture.

Ofcourse, you might find it a lot easier, Tony will, simply because he doesn't speak C. But C can produce better games as STOS basic. And when you know how to program in C writing a game isn't that hard. I wrote the C version of heartland in less then 10 days. Not bad for my very first game on the Atari ST. Ofcourse game concept was ready, I needed some time to get the graphics out of the original game and some extra time to figure out how their format is. A next game will be easier, because the keyboard handlers and music players are ready now.

Well, I haven't seen much games last few years, Tony's statement attracted my attention so, heare I am, and no, I don't know anything about Vidigrid 2, and your comments weren't very helpfull either.

>> Why, it's clear, I am doing more lines in the same time, so the code

Syncing to vbls is important on every atari that has more then 8 MHz, it ensures the game speed is the smae on all computers (exept for differences in the vertical frequency of the monitor).

> BTW, don't you have a day job or something?! If only I could get time
> to write a program just to see if it was faster than another!!

It didn't take too much time. I was simply a bit fed up with my normal programming work, so I did this game for fun (and to be right about C being faster ofcourse).

Bye, Hans Wessels

I believe you mean TOS 1.02. Yeah, I guess I should fix that.

So long as *prun contains the ACC's bpa, whether single-tasking or
multi-tasking, nothing needs to be done. If multi-tasking, nothing
needs to be done. If prun points to garbage (whether or not it is
used), that OS deserves to crash.

Precisely what I suggested about a month back - excep you seem to have
refined the concept considerably.

As long as you have a compile date encoded in the extension (so you can
compare realistically), that seems like the smart way to go.

Power without the Price was Atari's idea for a slogan. And a load of Crap. It defies logic and goes against All the Laws of the universe. Like "A Man is worthy of His Hire." and "You get what you Pay for." and "If it sounds too good to be true, It's probably a Lie." and in Atari's case, "You sow what you reap" aka "What goes around, comes around." Atari trying to appeal to cheapskates was it's undoing. Don't punish Toad because of an Atari Slogan. They're trying to support Atari, stay in business and feed their families. I just received a Toad-M SwitchBox which will let me use a MultiSync Monitor on my Atari ST to do Color and MonoChrome on the same MultiSync. This will also be the Last one Toad makes as their Technician is leaving because not enough people wanting to keep him Employed with a DEMAND for work. I know about the Crap that Bonafide Atari dealers put up with. And how many don't appreciate them. I blame it all on Atari, especially their slogan "Power without the Price!"

NO!, You are correct, we agree C can do GEM , but I do not dispute
that C can do fast arcade type games, I could well agree that C can do
fast arcade games,
To put simply, *IF* I could program in C and STOS, and wanted to make
a platform game then I would use STOS, there may be many tools that
can do one specific job, but I would claim that STOS would be the BEST
one to do that job, ie: my first choice, I also beleive that anyone
else in the same situation would also use STOS, that is what it is
for, that is the correct tool for the job and that would be top
choice,
I repeat I "could" agree C can do a platform game, but you have yet
to show me one, you show me the game you say you have made, show me it
using,
A larger play area
Better Sampled sound
More Animation
Better play area,

In fact show me your game with everything better, then C will be
better, but so far it is all talk,

>like you do in STOS, so if I can prove you wrong too on that point, there is
>nothing left for STOS to be better at.

So show me ?.......you have spent a lot of time telling me you can do
it, but shown me nothing ?, again I dont dispute your ability, I just
want to see :)

> >> Yes, I have almost finished the conversion of Heartland to C. The
> >> screen is

> > You sneaky devil you :)

>I am?

Well yes, you did not mention until nearly finished that you where
doing this, so yes sneaky devil, BTW "sneaky devil" is a freindly
expression :)

> > there is unused screen at the top,its an illusion and I know for a fact

> > simply thrown together, a lot of thought went into it

>I think they will notice. Game players aren't THAT stupid. For me it's simply a
>part of showing C is faster than STOS.

No one suggested game players are stupid, I simply pointed out that a
programmer can get away with a lot by using optical illusions, I mean
surely thats what the whole concept is based on ?????

Showing C is faster than STOS ? that would be a waste, no one is
disputing the level of the language, its not speed, its ability, show
me what C is capable of in game making, not how fast it is, I already
know C is faster,

>It works on my two Atari's. (1Mb TOS 1.0 and a 4Mb Kaos TOS). But working on a
>TT is simply a matter of starting the game on a TT. I don't expect any trouble
>there.

OK so the three or four game yearning TT owners out there will be
pleased :)
But then, we havent seen yours working on ANYTHING yet?

> > this is far less noticable at 8 pixels, and its only a programmer
> > examining the game that would notice, believe me no one else has ?

>Or no one cared to complaim, all being happy to get a new game for their ST?

You may be right, but I doubt it, no one is that desperate for a game
that they would then say its great, when its not?

> >> * It will work on a machine with 512kb or more memory
> >
> > NO!!! NOT IF YOU PUT EVERYTHING IN, you said you left half the game

>I will have to look for the extra STe and Falcon smaples. Up till now I only
>found one. (Thinking there was only one.)

Whoops, the falcon enhanced samples are in Diamond Ice, Diamond Ice
came AFTER Heartland so obviously has improved routines... so you
would never make that on a half meg, no way :)

> > I can do jagpad easilly enough, just didnt, actually its very simply
> > to implement,

>Maybe you didn't because detecting joystick, cursor youstick and joypad costs
>too much time?

It does not cost any time, it costs me going out and buying a pad,
its alright getting people to test certain aspects of a game, but some
you cannot trust to what people say, you have to see it for yourself
while programming or whatever, I only have a joystick so thats all its
programmed for, that simple really?,

> > Would like to see C make VidIgrid 2 hahahahaha
>
>What's VidIgrid 2? Does it run on my ST?

Yes, it takes a Video, FLM or VID or whatever, cuts it up into chunks
and displays it back on screen like a jigsaw, you pick up a peice with
the mouse and drop it where you think it should be,the peice already
there then flicks to the empty slot you left, if you have seen ViGrid
on the JAGUAR CD then its a complete copy of that, but with obviouse
lilitations,
There are 14 video clips on disk all cartoons edited to loop without
noticing where the loop occurs :)
sound simple ??
while you are moving a peice it is still playing the peice you are
moving,as well as all the other peices individualy,
At later levels there are 30 peices of the video playing individualy,
When you pick up and move a playing peice, NONE of the video slows
down :)

>there, the sprite will walk behind all objects like it does in your game. It's
>all the same, only a bit better. :-)

At this time, it is none existant,

>Sorry, haven't seen diamond ice, but my game has actually more animation than
>your Heartland, because the viewscreen is bigger, so there is more animation to
>be seen at the same time.

No I mean more items animated, where heartland had the coins, bottles
and spikes, diamond ice has those and another 8 objects animated, like
I say, later model, more advanced,

>They aren't the same, Heartland 2.0 is better, works on more machines, has an
>improved playing area. So there won't be two of the same, but the old version
>and the new improved version.

I hope you can show this soon, it is not nice of you to post public
messages telling everyone how much better your version is, but not let
anyone see it?

>Well, you have to test it, but I think you will have to agree it's better.

I would not count on it, I have yet to see it ?

> > although we would probably both have to show the actual source to
> > prove to anyone interested that only BASIC commands or only C
> > commands where used :)

>Oops, yes, maybe Tony doesn't want to include C anymore.

His name is Martin, Mine is Tony, Please don't put words into my
mouth :), Given the choice, I would use STOS BASIC before any other
BASIC to make a game, and if I also had the choice of C then I would
still choose STOS as it is better addapted for the job and therefore
the better tool,
Hans, YOU! are then only person who disputes this, everyone else
agrees, thus proving you to be in a miority of ONE!

>It didn't take too much time. I was simply a bit fed up with my normal
>programming work, so I did this game for fun (and to be right about C being
>faster ofcourse).

C being faster is not being disputed, C being the better choice for
game making is the bone of contention here, I would not say STOS is
faster than C, I cannot say STOS is more comapatable than C, (but
apart from a couple of SUPER machines then its no less compatable) all
I can say is that someone wanting to make a game that had all BASICS
and C to choose from, then STOS BASIC would be the best choice at this
moment in time, maybe not a couple of years ago, But now YES defintaly
the best choice!

Naturally it would be trivial for the os to write the current bpa to
prun and as such it should be done by any future tos compatible os
also. As MiNT uses "proper" process identifiers it made me wonder if
it does actually update the bpa? It should ... ;-)

help Please !!!!!
I own an aAtari 1040 st That i have used for Midi Music for 8 years now and I would like to tranfer all my midi files from Atari machine format to Dos format .the only way i know to do this would be to send them via modem .the only hick i have with this is time since I have quite a few (100 or so and via 2400 bds it would take foerever)
A couple of years ago i received a diskette for drum samples that could be read on my Atari and on my Ibm all the files are .mid format ,if i save my files in .mid format on my Atari it cannot be read on My I.b.m.
My question is :is there another way to do this with a programm or something ?Any kind of help would be GREATLY APRECIATED.
Thanks in advance-Daniel

In 1988, the cheapest PC Clone available in my area was an (PB)
8Mhz, 8088, w/ 640k & 10Meg HD, dual 5.25 floppies and a cga card.

It cost $1000.

A 520ST (w/ SS drive) cost $300.

Despite the appearace that that Clone outspecs this ST, the
ST ran circles around that machine and was quite a bit more
useable.
```

Just because you can't manage it now; it doesn't mean that it
never was.

Power without the Price, existed once.

It is not a far stretch to say that that is why many of us are here.

No, "ra", "aa", "aa+" DO NOT EXIST in ANSI C. It's an extension of Lattice C on the Ansi standard. The problem is that they don't say the second 'a' is an extension of their own.

There are two separate things:
1) If you have to program something the best language to do it in is the language you know best. In your case it would be STOS and I prefer C.
2) There is also a best languge to do some things. I think the best game language is the language that produces the best games, seen from the game players view. There it doesn't matter how hard the programming is, how ugly the interface to that language is or how unreadeble the source is. The only thing that matters is the result. (I am not saying that my source is unreadable, nor that my C compiler has an ugly interface, and I think we agree good coding is usually a hard job.)

> I repeat I "could" agree C can do a platform game, but you have yet

Has the sample quality to do anything with the power of the language? Don't think so, DMA sound is DMA sound, a longer sample, or an higher sample rate only consumes more memory.

> More Animation
> Better play area,

That's also a matter of design, I think.

> So show me ?.......you have spent a lot of time telling me you can do
> it, but shown me nothing ?, again I dont dispute your ability, I just
> want to see :)

Well, a preview version of heartland is on it's way to you. I send it you via i_a, because the mail system on my atari doesn't allow to send me HUGE mails.

A short overview of the keys:
Esc: quit game
s: toggle sound: DMA sound -> chip sound -> sound effects only -> no sound
m: show map
r: show rasters (= processor time left)
h: toggle 50/60 Hz (very unwise to do on an 8MHz ST)
f: enable fast machine mode, it will play a nibble scrolled game on machines
that are at least twice as fast as a normal 8MHz ST. (PS: My 20MHz turbo board
ST isn't fast enhough, still has a 8MHz bus)
n: toggle nibble scrolling

Still to be added:
*Fix for jumping out of the game area in the right part of the game field.
*Detection of being dead, now you life can be negative, doing funny effects on
the screen, maybe, if you wait long enough, the game will crash.
*Main menu screen
*Detection of game completion

Still to be tested:
*STe/Falcon/TT DMA sound
*STe/Falcon joypad
*TT/Falcon nibble scrolling (I realy wonder if a Falcon with VGA monitor is
fast enhough for nibble scrolling)
*The walk right sprite sequence contains a damaged sprite (never had a correct
version of the sprite data)
*working of the game on a half Meg machine (does anybody know the amount of
free memory on such a system?)

The game is not intended for massive spreading yet, but you may give copies to
people very intrested in the game. The game is only a preview.

> No one suggested game players are stupid, I simply pointed out that a
> programmer can get away with a lot by using optical illusions, I mean
> surely thats what the whole concept is based on ?????

Yes, but I think players will immediately see my version has a larger play
area. You could call your version a mordern wide screen version. :-)

> But then, we havent seen yours working on ANYTHING yet?

Please tell me: did you receive the game and did you like it?

>> I will have to look for the extra STe and Falcon smaples. Up till now
>> I only found one. (Thinking there was only one.)
>
> Whoops, the falcon enhanced samples are in Diamond Ice, Diamond Ice
> came AFTER Heartland so obviously has improved routines... so you
> would never make that on a half meg, no way :)

Never say never, I may be tempted to convert that game too :-)
The amount of sound data isn't the problem, just don't load it if you haven't
the memory for it. The only important thing is the amount of code and data
needed for the main gameplay. All other things can be reloaded when needed.
(Fastest access: put all data in one big file open it once at the game start and

'fseek' to the data position of the you need and load the stuff.

> It does not cost any time, it costs me going out and buying a pad,

Hmm, it does cost time to read the joypad, at least 8 clockcycles, but usually around the 100 cycles, so yes, time overhead of reading a joypad is very low.

>> Would like to see C make VidIgrid 2 hahahahaha

Yes, that's realy simple, it's no problem at all to do that in C, I think I can do it with a resolution 320x192, 240 16x16 pieces, movie going at 50 frames per second, 50 screen updates per second, all continues to play while ony pice is moving over the screen (including the pice you are moving). Just have the complete depacked sequence ready in memory, copy the current displayed part of the animation screen to the display memory (or change the screen adres when you are using a full screen puzzle, the piece moved is a sprited move over the screen (can by done real time). When two pieces swap places update them in all screens and off you go. Where is the problem? Maybe the movie depackers, I haven't got them in my code collection, but no doubt they are available somewhere.

>
> No I mean more items animated, where heartland had the coins, bottles
> and spikes, diamond ice has those and another 8 objects animated,
> like I say, later model, more advanced,

No problem at all. I can manage as many animated items as you like. The first thing geving problems is computer memory, because one 16x16 item costs 1kb in byte scrolling mode (2 kb for nibble scrolling). So if you want to have 512 items it's going to cost you half a Meg. You can put those items (or some groups of them) into an animation sequence. So a 4Mb machine can have about 3500 items that can be used in animations, allowing us to have 512kb of game code. The real problem is to find somone who will draw that many parts and put them together

into nice animations. Your fantasy is the limit here, not the programming language.

Samething for the level map. Make it as big as you like, the biggest problem is to find someone who will design it, alter the macro's (constants) MAP_LEN and MAP_HEIGHT in my C code and off you go, no problems with multiple overlapping maps like you did in heartland, just one big map. There is no 32k limit on the size of the map, nor on the seize of the item data. The only limit there is is the memory limit of the computer and, ofcourse, your fantasy.

> I hope you can show this soon, it is not nice of you to post public
> messages telling everyone how much better your version is, but not
> let anyone see it?

Requests for the finished game can be send to:
mr_ni@mst.tn.utwente.nl
It's my e-mail adress at the university, allowing me to send huge amounts of data cheap and easy. You will receive a copy of heartland 2.0 as soon as I think it's completely finished (let's say before the end of January, writing a program isn't hard, making a complete product is!).

>> Well, you have to test it, but I think you will have to agree it's
>> better.
>
> I would not count on it, I have yet to see it ?

And now?

> Just releasing the program is the problem hey ?
Yes, especially a finished and full debugged program, as soon as the code is working the fun is over, than the boring finishing starts.

> hahahahaha I wish you had put a smiley in the above, I really wish
> you had, Of course you can beat 3000, YOU have to see how,

Well, will have an other look. But I expect to find some extra bokkingen in your game. :-)

> Merry Christmas Hans <SMILE>

And a happy new year?

Bye, Hans Wessels

4129. MagiC radio buttons/check boxes - how to access?

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-27 00:00:00 UTC
From: mbecroft@tos.ak.planet.gen.nz
Message-ID: <GL2OCCUQUp@tos.ak.planet.gen.nz>
Source record: 8072

Although I am unsure about this, I seem to remember hearing somewhere that MagiC AES has its own inbuilt radio buttons and check boxes ("proper" ones that look like circles and crossed boxes respectively).

Since the MagiC programmer documentation is in German, it is difficult for me to use these features. Can someone explain how to use MagiC's radio butons and checkboxes (in English)? Thanks!

Also, how can I check for the presence of MagiC?

Any help would be appreciated.

Even under MagiC the launched program will be a child of the starting
process. This is sensible and necessary.

> calling application. I appreciate Andreas' comments of a while back that
> this is more sensible than Atari's mode 0 approach since it works to an

Why is functionality reduced ? Because others than MagiC's AES do not
bring preemptive multitasking ? That is not MagiC's fault.

> mind, Thing and Kobold being the most obvious.
>

You never thought of a MagiC version that one day will have an AES
version > 4.0 ?

I do not think this is sensible at all. But if you really need to make a
distinction, please do it properly. Check for the MagiC cookie, or even
better, call appl_getinfo to find out what works which way, instead of
just comparing the AES version.

Cheers Peter

This would be proper action. But note that under preemptive multitasking
the variable might not be the same anymore at the time of the Malloc.
It's unlikely, but difficulties may arise. The way to go is to do the
check and the Malloc in Supervisor context.

Cheers Peter

It's precisely like VDI drawing onto the screen. You only open a metafile workstation, instead of a screen workstation. You'll need META.SYS in your GEMSYS folder, or whatever it's called on your machine, and an entry in ASSIGN.SYS. Some special VDI calls then let you choose the filename, and write extra entries into the file.

Mfree and Fclose do not cause any harm, they may be called at any time.

This approach works with single-tasking TOS (i.e. original TOS versions without MiNT, MTOS AES or Geneva). With multi-tasking systems you'll cause problems here. So before using those ACCset and ACCreset calls you must inquire whether you're with multi-tasking, and thus whether you're allowed to use them.

Perhaps I should learn C then restate my claim?, I am confident
enough to keep my opinion as it is, STOS is best for making games, *I*
already proved this?

>2) There is also a best languge to do some things. I think the best game
>language is the language that produces the best games, seen from the game
>players view. There it doesn't matter how hard the programming is, how ugly the

NO!, the thread is meant to be from a programmers point of view, that
is why it is posted in a programming group and not a gameplayers
group, so I am right when I say that a programmer, NOW who can program
in STOS and C, he should choose STOS to make a game, because that is
what it is for, If he can not program at all, but his interest is in
programming games then he should learn STOS,

>that matters is the result. (I am not saying that my source is unreadable, nor
>that my C compiler has an ugly interface, and I think we agree good coding is
>usually a hard job.)

Ithink my source is unreadable, verry bad and speghetti linked, it
has line numbers and is hard to follow, but who cares, it is the end
result that counts?

>Has the sample quality to do anything with the power of the language? Don't

You say you can make a better version of Heartland, I say you can
not, are you saying you can make a faster version, but not better?
what is the point of that, you must make a better version or say STOS
is best......

> > Better play area,

>That's also a matter of design, I think.

I meant bigger, to prove your routine is capable of the task, with no
disk accesing during game play,

> > So show me ?.......you have spent a lot of time telling me you can do

>Well, a preview version of heartland is on it's way to you. I send it you via
>i_a, because the mail system on my atari doesn't allow to send me HUGE mails.

Thank you, It is not here yet but it is Christams and the post will
be slow, maybe a few more days,

> > programmer can get away with a lot by using optical illusions, I mean
> > surely thats what the whole concept is based on ?????

>Yes, but I think players will immediately see my version has a larger play
>area. You could call your version a mordern wide screen version. :-)

of course they will....that is not the point, the point is that mine
has a smaller play area and no one noticed, no one complained and no
one said the game suffered because of a small play area, because you
cannot tell it is small, they do not realise, it is an illusion,
Yes if you stick another version under there nose with a bigger play
are they will notice, but they havent got anothetr version, they have
heartland and like it, I realy do not see your point here, my point is
that the screen size is good enough and does the job, maybe a bigger
screen size will spoil the effect?, bigger and faster does not mean
better does it ?????

> > It does not cost any time, it costs me going out and buying a pad,

>Hmm, it does cost time to read the joypad, at least 8 clockcycles, but usually

Ho dear, do you not understand the concept of a programming group, or the whole idea of a debate or discusion?, Yes the above was my belief, I am now saying that due to information since received, that if I am shown what Hans says he can produce then I would not say STOS is faster, better yes!, faster no :), this is what I get out of threads like this, knowledge and information,

>>and C to choose from, then STOS BASIC would be the best choice at this
>>moment in time, maybe not a couple of years ago, But now YES defintaly
>>the best choice!

>BTW: Is the hole thread a trick to influence some programmers to code
> more games? ;-)

Very close, you are nearly right :)))
You see a lot of people have a very big missunderstanding about STOS, they see all the OLD games made years ago with the original STOS, these where terrible slow rubish type games that gave STOS a bad name, I released programs years ago that would be an absolout embarresment now, because STOS was so easy to use then everyone had a go and

produced some total crap, (Including me)
Unfortunatly the Public Domain Libraries stupidly accepted these programs, gave them a great description and sold them,
Now all these years later, those same programs with the same descriptions can be bought from public domain libraries thus giving everyone the idea that STOS is crap,
But now STOS has been upgraded and can produce quality arcade type games that will stand up in todays market and will compare well with any other programming language, it is very hard to change peoples attitude, they think STOS=CRAP, they ignore wihout even testing software simply because they know it is STOS,

I have received emails from people who are amazed that STOS is capable of such software and are getting out there disks and having another go,

This thread IS having the desired effect and making some people realise that STOS is not as bad as it used to be,

Ask Hans and anyone else, what they used to think of STOS, and ask if they have changed there mind in the last couple of months,
If I lose this debate <grin> I will still win because STOS has a better name, I hope you have looked at something made recently in STOS and are not commenting on the STOS of old, thats the mistake a lot of people have made coming into this thread, they have gone away with there tail between there legs :))

Cheers.............!ynoT

For your information, AES (with MagiC4) return 3.99 as AES-version,
the "official way" is to check appl_getinfo() for testing new AES
feature (such as shel_write extension). But appl_getinfo() is available
with AES >=4.0 (MultiTos, Geneva, N.AES, Oaesis, Xaaes) execpet MagiC4.
Please, test AESversion >= 3.99 or
AESversion >= 4.00 || get_cookie('MAGX')
and after, check appl_getinfo()

Hmm, don't remember that!

> What are you talking about ? I said that given the choice, STOS is
>the best language to make games in 1996 compared to any other BASIC, I

You did..

>then said that I would even add C, I never mentiond fast or
>compatability, please do not trry to put words into my mouth,

Fair point, words shoved in ones mouth can leave a bitter aftertaste if
they are off... ;)

> I have since stated some things, but I have not moved the posts, my
>original statment stands good, you have done nothing to prove it
>otherwise, you make a gallant attempt and you do get me into corners
>by talking a good debate,
>
Ahh, how honest of you Tony. A good debate, that is true. Over 100 posts
(most of which were between you two people). To me that is, indeed, a
good debate!

> But really at the end of the day we have to let the software do the
>talking, mine has, your has not.....figure that one out :)

True... unles the C version is released with AT LEAST the same graphics,
sounds, music, options, levels, gameplay, speed, etc of the original.
Add to it if you like Hans but we are still waiting... us STers!

>>* C works on all Atari systems, STOS doesn't

> The only computers a STOS written game does not work on is the so
>called supre computers, Hades and Madusa, I do not see that as a
>compatability problem, so your compatability argument although true,
>is pretty useless ?

Works on mine, so I'm okay Jack. No probs where I am...

>>* C produces working code for all Atari systems, STOS doesn't

> Is that not exactly the same point as above?, and I proved that to be
>a useless point...

True, the same point worded differently... unless in your 1st point you
mean you can not even run STOS on all machines let alone STOS-written
programs? Need to clear this one up Hans!

>>* C will work on newer (not yet existing) TOS versions, STOS won't

> How the hell can you make a statement like that, that is impossible
>to know, you are talking rubish here,

You are asuming that there will be newer TOS versions? Heheheh, are we
all going to wake up and Atari never really went away? Hehehe.

>>* C can do GEM game, STOS can't

> I think that is a dissadvantage to C, thus you just shot yourself in
>the foot,

I agreee, I have not seen a decent looking GEM game. GEM was most
certainly not designed to be used for arcade games I am sure.

>>* C produces faster code than STOS

> Yawn, so what, how fast do you want to PRINT "SOMETHING"

Very true. Okay, so it gives you more processing time to do other things
which might have to be omitted in STOS because you would not get the
free time. In assembler this time is enough but in C it must surely be
minimal, by comparison?

>>* C allows structured programming with functions and data structures,
>> STOS doesn't

> So what, that has got to be the one most stupid statement you have
>made, what point is there to that? you are right, but so what, I may
>as well say STOS is better because it uses line numbers? you seem to
>be scraping the bottom of the barrel for reasons here?

Or... at least STOS does not forse you to use stupid curly brackets ;)

The idea that structured programming = quicker processing is, as any
schoolboy home coder will know, a load of old wotsits. Why? Well, it may
well be easier to read and debug (this I agree is true) but as far as
faster processing? An unconditional "Goto" is often considered a
programming "sin". I have, in the past, done timed tests and found that
it is more often than not more processor effecient to skip true cyclic
programming.

Besides, STOS does allow structured programming if you wish to utilise
it. Functions may easily be created.

>>* C can be used for all kinds of programming, STOS can only do games

> WRONG, See other posting for proof positive that your statement is
>outlandishly ill-informed and to be honest, suprisingly cheap of you,

Oi! STOS can only do games? Rubbish! By that token C can only do
applications :P

>>* C can produce it's own libraries (language extensions), STOS needs
>> assembley to do that

> eeerm again, so what? what is so good about that? it doesent seem to
>do the C "games" programmer any good does it..

Plus you can write subroutines in STOS which can easily be merged into a
program, so you are again wrong mister!

>>Yet STOS is the best language to do games in? Get a life! STOS is nice to do

> "Get a life", if you find my replies to you have taken a sour tint to
>them, it is because you have taken to cheap insults like this, at no
>point have I ever made a personal insult to you, even this message you
>are quoting and replying to was not to you personally, yet you feel
>the need to personally insult me, you tell me to "get a life" ?,

Oooer!! Well Hans, here's some rope to help you out of that hole you
just fell in :)

>>games in, especially for unexperienced programmers, but it is
>>certainly not the best language to do games in.

> Yes it is....you are wrong, but it is not enough to be wrong, today
>you have to be childish and insulting, whats up, game not going to
>plan hahahaha

Hmm, this seems to be the feeling of so many bitter (?) people today.
They HAVE to be right. It is impossible for other people to have
anything correct to say which might contravene them. And you are right,
when they realise they have lost an arguement it gets personal!

>> > This thread IS having the desired effect and making some people
>> > realise that STOS is not as bad as it used to be,

Yes, shame Mandarin couldn't take teh heat and dumped it... they could
have relaunched it as STOS '97 with most of the popular
extensions/commands as default (freeing up more extensions!) and really
shown that STOS is a viable language for games and serious use. There
are still some uninformed peopel out there who think of STOS as a SEUCK
type of affair!

>>But still isn't as good as C always has been.

> I never said STOS was better than C, in fact I have made every effort
>to say that C is better than STOS,
> But if someone wants to make a game, then STOS is the best choice,

Exactly... hehhee, but just so you know... ">>But still isn't as good
as C always has been."!!!! Just in case ;)

>>Yes, it moved from total utter crap to could be sensible.

> How childish :(

Well, Tny, you are obviously dealing with a real debator here... someone who like sdebating a lot, a kind of "mass debator"? ;)

> Please stop talking about how good you are, and start showing, I am
>not going to have a debate with someone who resorts to childish
>witterings and cheap insults.....Goodbye :(

Wahay... hear! hear! Go on Hans, release that version of Heartland... go for it!!! You have nothing to lose, as you say C is so much better that STOS. Therefore we are waiting the game of teh century!! Oh, not too difficult with the lack of new releases, that's true!

Ooh! I look around and think I am lost here. I only came here for a bit of a wind up. Mind you, STOS is better than C, we all know that !!!!

HAHAHA!!

They may not cause harm, but they may not free the RAM or close the
file either.

p > So before using those ACCset and ACCreset calls you must
p > inquire whether you're with multi-tasking, and thus whether
p > you're allowed to use them.

Once again, if you are multi-tasking, cooperative or pre-emptive,
*prun will equal the accessory BPA (when you read it) unless it
isn't used at all (in which case changing it should do no harm).

(Actually, putting the test in is overkill, since at worst you will
be re-writing the current value.)

Doesn't count, only people who bother to respond to this tread count. I think most C coders see the header STOS and just skip. Maybe we should as MAUS.SYS.ATARI.SOFTWARE for their opinion. But determining which language is the best isn't a matter of majority. It can be proven that C beats STOS on any point that matters in game writing, so one person can be right and de rest of the universe can be wrong. Question is: are they willing to accept that, or will I be heretic and burned to death on the firestake? After all, earth is still turning around the sun. :-)

Well, you got the right message there, that's the massage that triggered me into converting the Heartland to C. Thank you!

You did? Well, yes, from STOS point of view, STOS is best for making games because it's the only thing it can be used for. But that doesn't matter to this discussion, because we were comparing STOS with other languages and then STOS is way behind C, even on it's speciality: arcade games.

The end result counts? No!, the thread is meant to be from a programmers point of view, that.. etc etc. Well, for the first time in the thread you contradicted yourself between to quotations, congratulations!

Yes, you don't have to tell me basic is easier to learn than C, but if your intention is to write real cool games and you don't want to use assembley you have to use C for the best results, not STOS.

> You say you can make a better version of Heartland, I say you can
> not, are you saying you can make a faster version, but not better?
> what is the point of that, you must make a better version or say STOS

> is best......

Well, by writing a faster game I proved C is at least on par with STOS on the arcade game type, taking all previous mentioned advantages of C in account, C is clearly the best.

> I meant bigger, to prove your routine is capable of the task, with no
> disk accesing during game play,

Do you think a mapsize of 320x200, or 640x100 will be big enhoug? I took these sizes because the complete map can't be displayed on screen when I am using bigger map size.

> bigger screen size will spoil the effect?, bigger and faster does not
> mean better does it ?????

Yep, maybe you are right, start using to old STOS routines again, the current allow you to show a too big screen and the game is also faster. In arcade games bigger and faster usually is better.

>> Hmm, it does cost time to read the joypad, at least 8 clockcycles, but
>> usually around the 100 cycles, so yes, time overhead of reading a
>> joypad is very low.
>
> you mean it takes MORE than reading a joystick ?

No, where did I say that? reading the joystick has to be done by a intterupt routine, or by sending IKBD command to the keyboard to request joystick data. Waiting for IKBD commands to be send takes really a lot of time. Intterupt routines take more time too. How much time does reading the normal joystick need in your oppinion?

Remember, we are talking about clockcycles, not scanlines, on a 8MHz ST one clockcycle is 125ns, a scanline is 512 clockcycles long, ie 64ms. At 50 Hz one screen is 160000 clock cycles. This information, plus a clockcycle table and some extra knowledge of bus usage during DE (display enable) allows you to create exactly synchronized screens, but that's assembly guru level stuff, but it can also done in (Omikron) basic or C.

>> Requests for the finished game can be send to:
>> mr_ni@mst.tn.utwente.nl

> like this, knowledge and information,

So you happily moved the goal! First was STOS better because it could to
blazing fast arcade games although it isn't as compatible as C is. Now STOS is
better because STOS is better (#define BETTER STOS). It's nicer to write games
in?... Let me summarize:

* C works on all Atari systems, STOS doesn't
* C produces working code for all Atari systems, STOS doesn't
* C will work on newer (not yet existing) TOS versions, STOS won't
* C can do GEM game, STOS can't
* C produces faster code than STOS
* C allows structured programming with functions and data structures,
STOS doesn't
* C can be used for all kinds of programming, STOS can only do games
* C can produce it's own libraries (language extensions), STOS needs
assembley to do that

Yet STOS is the best language to do games in? Get a life! STOS is nice to do
games in, especially for unexperienced programmers, but it is
certainly not the best language to do games in.

> This thread IS having the desired effect and making some people
> realise that STOS is not as bad as it used to be,

But still isn't as good as C always has been.

> Ask Hans and anyone else, what they used to think of STOS, and ask if
> they have changed there mind in the last couple of months,

Yes, it moved from total utter crap to could be sensible.

Hi there!

Mario Becroft (mbecroft@tos.ak.planet.gen.nz) wrote:
: Although I am unsure about this, I seem to remember hearing somewhere that
: MagiC AES has its own inbuilt radio buttons and check boxes ("proper" ones
: that look like circles and crossed boxes respectively).

It does, although I'm not really sure how to get at them. They may just
have to be called by creating a radio_button or check_box and calling it
extended type 13 or 14 with a resource editor...

: Also, how can I check for the presence of MagiC?

Check the TOS version number. It says 3.00 on my TOS 4.04 Falcon when
MagiC is running. It also tells me that I'm running AES version 3.99...

Not sure which cookie it is that says this, but I'm sure there is one...

From: marcelv@stack.nl
Message-ID: <5a1p9a$sgo@snail.stack.nl>
Source record: 8085

Hi all,
I've been scooping around for 'c' and 'c++' compilers. And found Pure C, Borland C and GNU C++. But I've come to the
conclusion that there is no way for a newbie to start without spending hours,days or months on all the functions, bits and bytes for programming. Are the small programs I can start with so I can get familiar with the userunfriendly userinterface of all those C compilers? (There should be a combined interface with the resource editor and the GNU C++ with object library function.).
Now I was wondering if there are any know standards in programming the Atari. Or do I have to find all possible libraries on the net and put them together to find out which functions are best to use?

Also I was wondering if anybody has used the STL include files with GNU C++ compiler. For me the STL is the best thing since it's so darn smart coding. I will try to continue to use the STL header files with GNU. But the compiler might use to much memory so it might be neccesary to use virtual memory. (slow!)

Guess those were my 2 cents,
Fuse

>blazing fast arcade games although it isn't as compatible as C is. Now STOS is
>better because STOS is better (#define BETTER STOS). It's nicer to write games
>in?... Let me summarize:

What are you talking about ? I said that given the choice, STOS is
the best language to make games in 1996 compared to any other BASIC, I
then said that I would even add C, I never mentiond fast or
compatability, please do not trry to put words into my mouth,
I have since stated some things, but I have not moved the posts, my
original statment stands good, you have done nothing to prove it
otherwise, you make a gallant attempt and you do get me into corners
by talking a good debate,

But really at the end of the day we have to let the software do the
talking, mine has, your has not.....figure that one out :)

>* C works on all Atari systems, STOS doesn't

The only computers a STOS written game does not work on is the so
called supre computers, Hades and Madusa, I do not see that as a
compatability problem, so your compatability argument although true,
is pretty useless ?

>* C produces working code for all Atari systems, STOS doesn't

Is that not exactly the same point as above?, and I proved that to be
a useless point...

>* C will work on newer (not yet existing) TOS versions, STOS won't

How the hell can you make a statement like that, that is impossible
to know, you are talking rubish here,

>* C can do GEM game, STOS can't

I think that is a dissadvantage to C, thus you just shot yourself in
the foot,

>* C produces faster code than STOS

Yawn, so what, how fast do you want to PRINT "SOMETHING"

>* C allows structured programming with functions and data structures,
> STOS doesn't

So what, that has got to be the one most stupid statement you have
made, what point is there to that? you are right, but so what, I may
as well say STOS is better because it uses line numbers? you seem to
be scraping the bottom of the barrel for reasons here?

>* C can be used for all kinds of programming, STOS can only do games

WRONG, See other posting for proof positive that your statement is
outlandishly ill-informed and to be honest, suprisingly cheap of you,

>* C can produce it's own libraries (language extensions), STOS needs
> assembley to do that

eeerm again, so what? what is so good about that? it doesent seem to
do the C "games" programmer any good does it..

>Yet STOS is the best language to do games in? Get a life! STOS is nice to do

"Get a life", if you find my replies to you have taken a sour tint to
them, it is because you have taken to cheap insults like this, at no
point have I ever made a personal insult to you, even this message you
are quoting and replying to was not to you personally, yet you feel
the need to personally insult me, you tell me to "get a life" ?,

>games in, especially for unexperienced programmers, but it is
>certainly not the best language to do games in.

Yes it is....you are wrong, but it is not enough to be wrong, today
you have to be childish and insulting, whats up, game not going to
plan hahahaha

> > This thread IS having the desired effect and making some people
> > realise that STOS is not as bad as it used to be,

>But still isn't as good as C always has been.

I never said STOS was better than C, in fact I have made every effort
to say that C is better than STOS,
But if someone wants to make a game, then STOS is the best choice,

> > Ask Hans and anyone else, what they used to think of STOS, and ask if
> > they have changed there mind in the last couple of months,

>Yes, it moved from total utter crap to could be sensible.

How childish :(

Please stop talking about how good you are, and start showing, I am
not going to have a debate with someone who resorts to childish
witterings and cheap insults.....Goodbye :(

Cheers.............!ynoT

Well done Hans, you just ended this thread...thanks :))

>because it's the only thing it can be used for. But that doesn't matter to this

WHAT!!!!!!! eh? what do you mean its the only thing it can be used
for, we went through this once and I proved you wrong once,

eg: there are more diskzines in the UK using a STOS written shell
than any other,
eg: The only multimedia displayer for a FM that allows text,
animation, sampled sound, music, colourd text, choice of fonts etc in
the one file is a STOS program

And other peoples software, well how about Video Supreme? show me a
rival to that, or how about grafix, both are COMMERCIAL programs, NOT
games and are STOS, Education titles, STOS surely rules in that
department, there are lots of instances of STOS in public domain and
commercialy released software that are not games,

You say STOS can only do games, ???? You are wrong again.....

>discussion, because we were comparing STOS with other languages and then STOS is
>way behind C, even on it's speciality: arcade games.

So you keep saying, I proved STOS is better, and until you can prove
otherwise then you are wrong, talk is cheap!

>intention is to write real cool games and you don't want to use assembley you
>have to use C for the best results, not STOS.

again, I proved STOS is best, now you please stop talking and start
proving...yes?

> > what is the point of that, you must make a better version or say STOS
> > is best......

>Well, by writing a faster game I proved C is at least on par with STOS on the

NO NO NO, you have talked about it, you have proved nothing, I showed
you a good arcade style , fast smooth game, you have not showed me a
arcade type game written in C, you just talked about it, that is NOT
proof,

>allow you to show a too big screen and the game is also faster. In arcade games
>bigger and faster usually is better.

In YOUR opinion...

> > you mean it takes MORE than reading a joystick ?
>
>No, where did I say that? reading the joystick has to be done by a intterupt

You accused me of not adding Joypad support because the main loop
could not handle the time, I say I already check for joystick, so in
the options screen someone chooses a jagpad then I simply swap a few
pointers and the routine looks for jagpad instead of joystick, same
time, no problem....so me not including jagpad was because I havent
got one to test with, and NOT because of proc time as you suggest,
your wrong again,

> >> Requests for the finished game can be send to:
> >> mr_ni@mst.tn.utwente.nl
> >
> > yes request it, talk about it....but we still have not seen it?
>
>It will be released. Please allow me some time to finish the product. It will
>be finished before februari 1997.

So you get a couple of months brainwashing everyone by telling them
you can do it, you tell everyone its faster and better and you tell
everyone you have proved it,
Why not wait until you have done it before you start telling everyone
how good you are ?

Cheers.............!ynoT

If ob_flags bit15 is set in a normal G_BUTTON then a toggle is drawn.
If the button is a radio button then a Mac style radio button will be
drawn instead. Normal Gem ignores this and displays the usual way.

>Also, how can I check for the presence of MagiC?

Look in the cookie jar for MAGX. It contains a pointer to the
MAGX_COOKIE structure which is defined in magx.h.

The Atari Compendium CD has all sorts of things, including some of the
more recent standards for GEM interfaces, etc. It also contains a lot
of associated source code and samples, as well as the docs on AES,
VDI, XBIOS, etc. I got mine for about $30 USD.

Hope this helps,
John

I'm not sure what you mean by "creating a radio_button or check_box".

>
>Check the TOS version number. It says 3.00 on my TOS 4.04 Falcon when
>MagiC is running. It also tells me that I'm running AES version 3.99...

That would be unreliable, since any AES could be version 3.99, and any TOS version could be 3.00. I was wanting to know how to check for the presence of MagiC, not for the AES or TOS version number.

Surely there is some cookie that signifies that MagiC is present?

>blazing fast arcade games although it isn't as compatible as C is. Now STOS is
>better because STOS is better (#define BETTER STOS). It's nicer to write games
>in?... Let me summarize:

What are you talking about ? I said that given the choice, STOS is
the best language to make games in 1996 compared to any other BASIC, I
then said that I would even add C, I never mentiond fast or
compatability, please do not trry to put words into my mouth,
I have since stated some things, but I have not moved the posts, my
original statment stands good, you have done nothing to prove it
otherwise, you make a gallant attempt and you do get me into corners
by talking a good debate,

But really at the end of the day we have to let the software do the
talking, mine has, your has not.....figure that one out :)

>* C works on all Atari systems, STOS doesn't

The only computers a STOS written game does not work on is the so
called supre computers, Hades and Madusa, I do not see that as a
compatability problem, so your compatability argument although true,
is pretty useless ?

>* C produces working code for all Atari systems, STOS doesn't

Is that not exactly the same point as above?, and I proved that to be
a useless point...

>* C will work on newer (not yet existing) TOS versions, STOS won't

to know, you are talking rubish here,

>* C can do GEM game, STOS can't

I think that is a dissadvantage to C, thus you just shot yourself in
the foot,

>* C produces faster code than STOS

Yawn, so what, how fast do you want to PRINT "SOMETHING"

>* C allows structured programming with functions and data structures,
> STOS doesn't

So what, that has got to be the one most stupid statement you have
made, what point is there to that? you are right, but so what, I may
as well say STOS is better because it uses line numbers? you seem to
be scraping the bottom of the barrel for reasons here?

>* C can be used for all kinds of programming, STOS can only do games

WRONG, See other posting for proof positive that your statement is
outlandishly ill-informed and to be honest, suprisingly cheap of you,

>* C can produce it's own libraries (language extensions), STOS needs
> assembley to do that

eeerm again, so what? what is so good about that? it doesent seem to
do the C "games" programmer any good does it..

>Yet STOS is the best language to do games in? Get a life! STOS is nice to do

"Get a life", if you find my replies to you have taken a sour tint to
them, it is because you have taken to cheap insults like this, at no
point have I ever made a personal insult to you, even this message you
are quoting and replying to was not to you personally, yet you feel
the need to personally insult me, you tell me to "get a life" ?,

>games in, especially for unexperienced programmers, but it is
>certainly not the best language to do games in.

Yes it is....you are wrong, but it is not enough to be wrong, today
you have to be childish and insulting, whats up, game not going to
plan hahahaha

> > This thread IS having the desired effect and making some people
> > realise that STOS is not as bad as it used to be,

>But still isn't as good as C always has been.

I never said STOS was better than C, in fact I have made every effort
to say that C is better than STOS,
But if someone wants to make a game, then STOS is the best choice,

> > Ask Hans and anyone else, what they used to think of STOS, and ask if
> > they have changed there mind in the last couple of months,

>Yes, it moved from total utter crap to could be sensible.

How childish :(

Please stop talking about how good you are, and start showing, I am
not going to have a debate with someone who resorts to childish
witterings and cheap insults.....Goodbye :(

Cheers.............!ynoT

>You did? Well, yes, from STOS point of view, STOS is best for making games

Well done Hans, you just ended this thread...thanks :))

>because it's the only thing it can be used for. But that doesn't matter to this

WHAT!!!!!!! eh? what do you mean its the only thing it can be used
for, we went through this once and I proved you wrong once,

eg: there are more diskzines in the UK using a STOS written shell
than any other,
eg: The only multimedia displayer for a FM that allows text,
animation, sampled sound, music, colourd text, choice of fonts etc in
the one file is a STOS program

And other peoples software, well how about Video Supreme? show me a
rival to that, or how about grafix, both are COMMERCIAL programs, NOT
games and are STOS, Education titles, STOS surely rules in that
department, there are lots of instances of STOS in public domain and
commercialy released software that are not games,

You say STOS can only do games, ???? You are wrong again.....

>discussion, because we were comparing STOS with other languages and then STOS is
>way behind C, even on it's speciality: arcade games.

So you keep saying, I proved STOS is better, and until you can prove
otherwise then you are wrong, talk is cheap!

>intention is to write real cool games and you don't want to use assembley you
>have to use C for the best results, not STOS.

again, I proved STOS is best, now you please stop talking and start
proving...yes?

> > what is the point of that, you must make a better version or say STOS
> > is best......

>Well, by writing a faster game I proved C is at least on par with STOS on the

NO NO NO, you have talked about it, you have proved nothing, I showed
you a good arcade style , fast smooth game, you have not showed me a
arcade type game written in C, you just talked about it, that is NOT
proof,

>allow you to show a too big screen and the game is also faster. In arcade games
>bigger and faster usually is better.

In YOUR opinion...

> > you mean it takes MORE than reading a joystick ?
>
>No, where did I say that? reading the joystick has to be done by a intterupt

You accused me of not adding Joypad support because the main loop
could not handle the time, I say I already check for joystick, so in
the options screen someone chooses a jagpad then I simply swap a few
pointers and the routine looks for jagpad instead of joystick, same
time, no problem....so me not including jagpad was because I havent
got one to test with, and NOT because of proc time as you suggest,
your wrong again,

> >> Requests for the finished game can be send to:
> >> mr_ni@mst.tn.utwente.nl
> >
> > yes request it, talk about it....but we still have not seen it?
>
>It will be released. Please allow me some time to finish the product. It will
>be finished before februari 1997.

So you get a couple of months brainwashing everyone by telling them
you can do it, you tell everyone its faster and better and you tell
everyone you have proved it,
Why not wait until you have done it before you start telling everyone
how good you are ?

Cheers.............!ynoT

If ob_flags bit15 is set in a normal G_BUTTON then a toggle is drawn.
If the button is a radio button then a Mac style radio button will be
drawn instead. Normal Gem ignores this and displays the usual way.

>Also, how can I check for the presence of MagiC?

Look in the cookie jar for MAGX. It contains a pointer to the
MAGX_COOKIE structure which is defined in magx.h.

The Atari Compendium CD has all sorts of things, including some of the
more recent standards for GEM interfaces, etc. It also contains a lot
of associated source code and samples, as well as the docs on AES,
VDI, XBIOS, etc. I got mine for about $30 USD.

Hope this helps,
John

Well I can been so entertained by this reproire that I feel I simply
have to jump in and say "Well done!". Ypou two should write for a BBC
comedy series, good family entertainment. Anyway, enough. I have come
back to add a few more (useless?) points?

>>So you happily moved the goal! First was STOS better because it could to
>>blazing fast arcade games although it isn't as compatible as C is. Now STOS is
>>better because STOS is better (#define BETTER STOS). It's nicer to write games
>>in?... Let me summarize:

Hmm, don't remember that!

> What are you talking about ? I said that given the choice, STOS is
>the best language to make games in 1996 compared to any other BASIC, I

You did..

>then said that I would even add C, I never mentiond fast or
>compatability, please do not trry to put words into my mouth,

Fair point, words shoved in ones mouth can leave a bitter aftertaste if
they are off... ;)

> I have since stated some things, but I have not moved the posts, my
>original statment stands good, you have done nothing to prove it
>otherwise, you make a gallant attempt and you do get me into corners
>by talking a good debate,
>
Ahh, how honest of you Tony. A good debate, that is true. Over 100 posts
(most of which were between you two people). To me that is, indeed, a
good debate!

> But really at the end of the day we have to let the software do the
>talking, mine has, your has not........figure that one out :)

True... unles the C version is released with AT LEAST the same graphics,
sounds, music, options, levels, gameplay, speed, etc of the original.
Add to it if you like Hans but we are still waiting... us STers!

>>* C works on all Atari systems, STOS doesn't

> The only computers a STOS written game does not work on is the so
>called supre computers, Hades and Madusa, I do not see that as a
>compatability problem, so your compatability argument although true,
>is pretty useless ?

Works on mine, so I'm okay Jack. No probs where I am...

>>* C produces working code for all Atari systems, STOS doesn't

> Is that not exactly the same point as above?, and I proved that to be
>a useless point...

True, the same point worded differently... unless in your 1st point you
mean you can not even run STOS on all machines let alone STOS-written
programs? Need to clear this one up Hans!

>>* C will work on newer (not yet existing) TOS versions, STOS won't

> How the hell can you make a statement like that, that is impossible
>to know, you are talking rubish here,

You are asuming that there will be newer TOS versions? Heheheh, are we
all going to wake up and Atari never really went away? Hehehe.

>>* C can do GEM game, STOS can't

> I think that is a dissadvantage to C, thus you just shot yourself in
>the foot,

I agreee, I have not seen a decent looking GEM game. GEM was most
certainly not designed to be used for arcade games I am sure.

>>* C produces faster code than STOS

> Yawn, so what, how fast do you want to PRINT "SOMETHING"

Very true. Okay, so it gives you more processing time to do other things
which might have to be omitted in STOS because you would not get the
free time. In assembler this time is enough but in C it must surely be
minimal, by comparison?

>>* C allows structured programming with functions and data structures,
>> STOS doesn't

> So what, that has got to be the one most stupid statement you have
>made, what point is there to that? you are right, but so what, I may
>as well say STOS is better because it uses line numbers? you seem to
>be scraping the bottom of the barrel for reasons here?

Or... at least STOS does not forse you to use stupid curly brackets ;)

The idea that structured programming = quicker processing is, as any
schoolboy home coder will know, a load of old wotsits. Why? Well, it may
well be easier to read and debug (this I agree is true) but as far as
faster processing? An unconditional "Goto" is often considered a
programming "sin". I have, in the past, done timed tests and found that
it is more often than not more processor effecient to skip true cyclic
programming.

Besides, STOS does allow structured programming if you wish to utilise
it. Functions may easily be created.

>>* C can be used for all kinds of programming, STOS can only do games

> WRONG, See other posting for proof positive that your statement is
>outlandishly ill-informed and to be honest, suprisingly cheap of you,

Oi! STOS can only do games? Rubbish! By that token C can only do
applications :P

>>* C can produce it's own libraries (language extensions), STOS needs
>> assembley to do that

> eeerm again, so what? what is so good about that? it doesent seem to
>do the C "games" programmer any good does it..

Plus you can write subroutines in STOS which can easily be merged into a
program, so you are again wrong mister!

>>Yet STOS is the best language to do games in? Get a life! STOS is nice to do

> "Get a life", if you find my replies to you have taken a sour tint to
>them, it is because you have taken to cheap insults like this, at no
>point have I ever made a personal insult to you, even this message you
>are quoting and replying to was not to you personally, yet you feel
>the need to personally insult me, you tell me to "get a life" ?,

Oooer!! Well Hans, here's some rope to help you out of that hole you
just fell in :)

>>games in, especially for unexperienced programmers, but it is
>>certainly not the best language to do games in.

> Yes it is....you are wrong, but it is not enough to be wrong, today
>you have to be childish and insulting, whats up, game not going to
>plan hahahaha

Hmm, this seems to be the feeling of so many bitter (?) people today.
They HAVE to be right. It is impossible for other people to have
anything correct to say which might contravene them. And you are right,
when they realise they have lost an arguement it gets personal!

>> > This thread IS having the desired effect and making some people
>> > realise that STOS is not as bad as it used to be,

Yes, shame Mandarin couldn't take teh heat and dumped it... they could
have relaunched it as STOS '97 with most of the popular
extensions/commands as default (freeing up more extensions!) and really
shown that STOS is a viable language for games and serious use. There
are still some uninformed peopel out there who think of STOS as a SEUCK
type of affair!

>>But still isn't as good as C always has been.

> I never said STOS was better than C, in fact I have made every effort
>to say that C is better than STOS,
> But if someone wants to make a game, then STOS is the best choice,

Exactly... hehhee, but just so you know... ">>But still isn't as good
as C always has been."!!!! Just in case ;)

>>Yes, it moved from total utter crap to could be sensible.

> How childish :(

Well, Tny, you are obviously dealing with a real debator here... someone who like sdebating a lot, a kind of "mass debator"? ;)

> Please stop talking about how good you are, and start showing, I am
>not going to have a debate with someone who resorts to childish
>witterings and cheap insults.....Goodbye :(

Wahay... hear! hear! Go on Hans, release that version of Heartland... go for it!!! You have nothing to lose, as you say C is so much better that STOS. Therefore we are waiting the game of teh century!! Oh, not too difficult with the lack of new releases, that's true!

Ooh! I look around and think I am lost here. I only came here for a bit of a wind up. Mind you, STOS is better than C, we all know that !!!!

HAHAHA!!

Lighten up everybody... |-|appy |\|ew '/ear

HI,

I suggest MEGAMAX C, if you can find a copy of it. It came originally with
a visual design interface and code generator for the atari STs and GEM.

This was a 2 pass compiler and made excellent 68000 code. The other
quality C compiler for the STs was the Lattice C compiler. I think
Michtron was handling that one last I looked.

regards.

Pete

> especially their slogan "Power without the Price!"
>
> ==Thanx==
> ===Ben===

Ben, I used to hate it when people said that Atari was dead. But now
its true.
There is no more Atari computer company. Your 'Multisync Switch Box' is
not
only totally unnecessary on new equipment (the need for such was just a
way to
sell monitors anyway), but you can make one yourself with a small platic
box
and a rotary switch. Total cost about $5-$10 and 30 mins to an hour of
work.
So, forgive me if I'm not floored at the loss of the WonderTech and his
super switch box.

Toad prices suck. All Atari prices such. A Pentium 90 w/512K cache,
dual EIDE
controllers, dual 16550 UART serial ports, parallel, full PCI, etc, is
$250!
Add a case, hard disk, monitor, and keyboard - all of which can be had
at your
local sidewalk sale for pennies, and you have a decent machine. Add
Linux for
an OS and you never have to look at MicroSloth either. I hate Intel,
but the
ST just doesn't have the power, and its WAY too expensive to upgrade.
That's
why I dumped the Atari 8-bit - upgrade was too expensive. Now there
isn't any
cheap Atari to upgrade too. Sure a Hades would be great, but if I was
gonna
buy another unsupported piece of hardware, I'd get a BeBox - at least
that has
some upgradeability and a decent price point.

CYA,
Evan

On 29 Dec 1996 01:16:16 GMT, in comp.sys.atari.programmer you wrote:

>Well, since you guys have turned this newsgroup into the "MPLIBTYPL"

We are discussing the most appropriate programming language between
BASIC and C for making games, please try to understand the thread
before complaining,

>instead of the forum for exchanging programming info that it was

Ho realy ?, read some of the messages, there is more programming
information in this thread than you will find anywhere else, STOS and
C and other BASICS have all been covered, Yes a fair amount of
bickering that we happen to be enjoying thank you,

Nevertheless if you look then you will see a hell of a lot of
programming information, all you have to do is look?,

For examply this is a STOS thread, yet I have learnt more about C
than I ever learnt anywhere else, Hopefully others have learnt about
STOS, try looking at the positive, not the negative,

Your suggestion that programming information has not been exchanged
in this thread is..is well just rediculous to the extreme,

>intended for, I guess I have no further use for the waste of
>bandwidth. I'm unsubscribing.

That is your choice, maybe if we start to talk about knitting then
that will be acceptable ?, but we have a saying for the above, it's
called "Cutting off your nose to spite your face"

>It's a damn shame that Atarians have to act like Sinclap.

You may not like this thread, but it is on topic, it does comply with
the spirit of the newsgroup by the fact that it is about programming
and there is a lot of information, SO WHY HAVE YOU JUST MADE A
PERSONAL INSULT TO ME ??

We all know it would have been simple for you to ignore this thread,
but instead you felt the need to jump in and make ill informed
statements and personal insults :(

Cheers.............!ynoT

>
> Well done Hans, you just ended this thread...thanks :))

This is an argument of type 1. The best programming language to do something in is the computer language you know best. No discussion possible on this point. In this thread we are discussing which programming language is the best one to write games in.

Most important part is here the speed of the resulting game (because the thread evolved to the arcade game type, and arcade games need smooth animations and fast response to user action, to accomplish that the language has to be fast.)

>> because it's the only thing it can be used for. But that doesn't
>> matter to this
>
> WHAT!!!!!!! eh? what do you mean its the only thing it can be used
> for, we went through this once and I proved you wrong once,

I know, I was stating things a bit black white. STOS was primary written as an game programming language, and ofcourse, you can do other things with susch a language.

>> discussion, because we were comparing STOS with other languages and
>> then STOS
> is
>> way behind C, even on it's speciality: arcade games.
>
> So you keep saying, I proved STOS is better, and until you can prove

I can prove it, the code is running overhere, for now you simply have to believe me, to morrow (30-12-1996) you can test the game (that is if the mail wont be screwed up again).

>> intention is to write real cool games and you don't want to use
>> assembley you have to use C for the best results, not STOS.
>
> again, I proved STOS is best, now you please stop talking and start
> proving...yes?

I will, I told you I will, so I will, is it so hard to believe what I am claiming? Or are you eager to get a better version of the game?

>> Well, by writing a faster game I proved C is at least on par with STOS
>> on the

> time, no problem....so me not including jagpad was because I havent
> got one to test with, and NOT because of proc time as you suggest,
> your wrong again,

No, I am reading Jouystick cursor keys and you pad at the same time. You can play whith any of them and change at all times. So I need time to scan the keyboard and get the joystick actions and time to read the joypad. So more input devices will take more time in my case.

> So you get a couple of months brainwashing everyone by telling them
> you can do it, you tell everyone its faster and better and you tell
> everyone you have proved it,
> Why not wait until you have done it before you start telling everyone
> how good you are ?

Either I have to be called sneaky devil because I am not telling I was working on the game or I am salling vapor ware. My delemma is that I have to prove that C is better and at the same time I want to do a realy good game, not just a bit of a game just lloking like heartland, but a bit better like you ask. That will take time. So I am gaving away a preview right now and will release the completed game in a month.

STOS is the best language to make games in 1996.
Can I make a GEM game? No.
Can I make a game for a so called super computer? (including TT's) No.
Will my game work on a not yet released TOS version? No.

Why should I use STOS then?

In <32b03219.1215756@news.airtime.co.uk> Tony Greenwood wrote:
...
> I still feel STOS would taking the above into consideration be the

...

Now you are on the point saying STOS isn't as fast as C is. Please tell me
what's left except your feeling STOS is better? What arguments are left for
STOS?

>> * C works on all Atari systems, STOS doesn't
>
> The only computers a STOS written game does not work on is the so
> called supre computers, Hades and Madusa, I do not see that as a
> compatability problem, so your compatability argument although true,
> is pretty useless ?

It isn't working on the TT too. Useless? Please let the programmer decide on
which computers the game should work, not the programming language. Are you to
decide super computer owners shouldn't have games?

>> * C produces working code for all Atari systems, STOS doesn't
>
> Is that not exactly the same point as above?, and I proved that to be
> a useless point...

No, the first is you can program on al the computers, that is writing the code compiling the code into a complet program. The second point is on which systems should the compiled code work. I am writing code on my ST targeted for all other Atari computers, or in the case of heartland 2.0 targeted to ST, STe, Falcon and TT. An hades owner can write code on his Hades that is ment to be used on an ST. So the first is development, the second is the target platform Clearly two different things.

>> * C will work on newer (not yet existing) TOS versions, STOS won't
>
> How the hell can you make a statement like that, that is impossible
> to know, you are talking rubish here,

No, not in case of STOS. STOS has a table with the OS adress of certain routines or tables. In a newer OS the adres will probably be different. Most other languages use trapes and documented system vectors to acces the OS.

>> * C can do GEM game, STOS can't
>
> I think that is a dissadvantage to C, thus you just shot yourself in
> the foot,

Please explain me why... You don't have to use GEM, you CAN use GEM. The choise is to the programmer.

>> * C produces faster code than STOS
>
> Yawn, so what, how fast do you want to PRINT "SOMETHING"

How fast do you want to display your background sprites?

>> * C allows structured programming with functions and data structures,
>> STOS doesn't
>
> So what, that has got to be the one most stupid statement you have
> made, what point is there to that? you are right, but so what, I may
> as well say STOS is better because it uses line numbers? you seem to
> be scraping the bottom of the barrel for reasons here?

Data structures and functions are usefull in more advanced games like tet adventures board games with an 'intelligent' computer opponent.

>> * C can be used for all kinds of programming, STOS can only do games
>
> WRONG, See other posting for proof positive that your statement is
> outlandishly ill-informed and to be honest, suprisingly cheap of you,

Yes it is, I was thinking about a lot of GEM stuff and so on, maybe even a compression program?

>> * C can produce it's own libraries (language extensions), STOS needs
>> assembley to do that
>
> eeerm again, so what? what is so good about that? it doesent seem to
> do the C "games" programmer any good does it..

Well, I designed some routines for heartland. I might put those together in a library for next time use?

> "Get a life", if you find my replies to you have taken a sour tint to
> them, it is because you have taken to cheap insults like this, at no
> point have I ever made a personal insult to you, even this message
> you are quoting and replying to was not to you personally, yet you
> feel the need to personally insult me, you tell me to "get a life" ?,

If getting a live is insulting I will take my words back. I underestimated the power of that saying then. I thought I was a proper way to ask you to review all arguments again.

>> But still isn't as good as C always has been.
>
> I never said STOS was better than C, in fact I have made every effort
> to say that C is better than STOS,
> But if someone wants to make a game, then STOS is the best choice,

That is not the same as saying STOS is the best game language. If someone wants to make a game the programming language he knows best is the best choise. It's not possible to argue about that. We can only argue about which wich language can make the best game.

Trust me, it will be there. I can either rush a same version out right now
(with al larger visible play field) or a far better version within a month?
Which one do you want?

>>> * C will work on newer (not yet existing) TOS versions, STOS won't

> we all going to wake up and Atari never really went away? Hehehe.

There are new TOS versions (patched versions) in the new super computers. A
complete new TOS comaptible OS is called magic. I think there will be a day
there won't be TOS in ROM but Magic. There is the phenix project develloping a
new TOS version. So yes, there are still changes for a new TOS version.

>>> * C can do GEM game, STOS can't

> I agreee, I have not seen a decent looking GEM game. GEM was most
> certainly not designed to be used for arcade games I am sure.

That's true, but you DON'T to have use GEM, you CAN use GEM if you want. For
example if you want to write a game like Free cell. This is exactly what I mean
with moving goal posts. You are thinking about arcade games for ST's. A best
programming language for games has to do all king of games, GEM and non GEM.

Otherwise it's something like the best programing language for arcade games.

>>> * C produces faster code than STOS
>

> be minimal, by comparison?

Well, in my version of heartland I can show a game area of 160 lines on screen instead of 128 let mes see... 160/128*100% = 125% so 25% more screen. I wouldn't call that minimal.

Can I set the ob_spec field of the G_BUTTON to a null pointer if I do not want any text to be drawn beside the radio button or check box? (I don't have MagiC myself, so I can't test this.)

Also, how much room should I allow for the button? Under Geneva, for example, an extra three characters are taken up with the button, so the object must be made three characters wider than the text.

Thank you for your help.

Well, Tony, it seems you still enjoying our little discussion. A was afraid I had gone too far... Phew! :-)

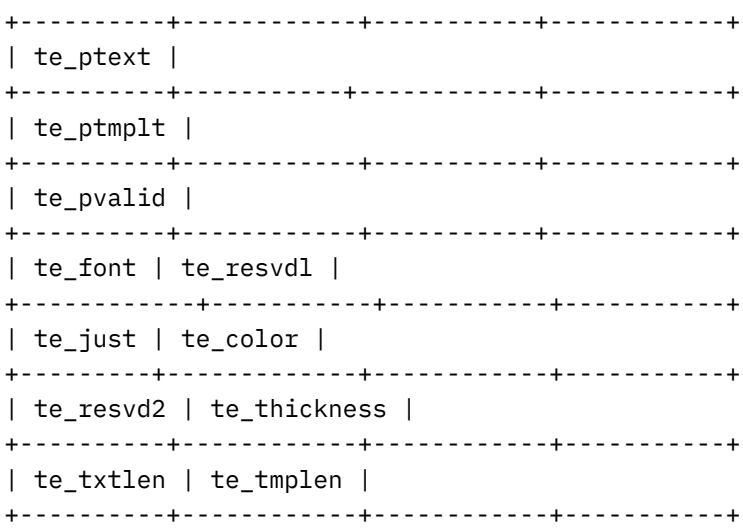
Bye, Hans Wessels

PS: Just after I gave the new game to Arnoud to send it to you (did you receive it already?) I discovered a bug. :-((Let's call it the well known demo effect.) When viewing the map I am scanning joysticks and joypad for the fire button to contine the game, even on normal ST's but on an ST there is no joypad, so a bus error is generated. This won't happen on STe's because joypads are possible there, only ST's and TT have this bug.

4169. Re: TEDINFO

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-29 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19961229210400.QAA18291@ladder01.news.aol.com>
Source record: 8012

The TEDINFO structure lets a user edit formatted text. The object types
G_TEXT, G_BOXTEXT, G_FTEXT, and, G_FBOXTEXT use their ob_spec pointers to
point to TEDINFO structures.



te_ptext - A POINTER to the actual text.

If the first text character is "@", the field is blank, and the
application can use any characters for the remainin character posistions
in the field. For example, a te_ptext string "@xyzpdq" is seven blank
spaces.

te_ptmplt - A POINTER to a text string template for any further data
entry. The editable portion of the field is represented by underscores.

te_pvalid - A POINTER to a text sting containing characters that validate
any entered text.

9 - allow only digits 0 - 9
A - allow only uppercase A - Z plus space
a - allow upper- and lowercase A- Z, plus space
N - allow 0 - 9 and uppercase A- Z, plus space
n - allow 0 - 9 upper- and lowercase A- Z, plus space
F - allow all valid DOS filename characters, plus ? * :
P - allow all valid DOS pathname characters, plus \ : ? *
p - allow all valid DOS pathname characters, plus \ :
X - allow anything

te_font - A WORD identifying the font used to draw the text.

3 - system font: used in menus, dialogs, etc.
5 - small font: used in icons

te_resvdl - Reserved for future use

te_just - A WORD identifying the type of text justification desired.

0 - left-justified
1 - right justified
2- centered

te_color - A WORD identifying the color and pattern of box-type objects.

te_resvd2- Reserved for future use

te_thickness - A WORD containing the thickness in pixels of the border of the text box. This WORD can have the following values:

00 = no thickness

1 - 128 (positive values) = inside thickness: inward from the object's edge
-1 - (-127) (negative values) = outside thickness: outward from the object's edge

te_txtlen - A WORD containing the length of the string pointed to by te_ptext.

te_tmplen - A WORD containing the length of the string pointed to by te_ptmplt.

The following example illustrates how the TEDINFO structure works.

- te_ptext is a string of raw data for a date. Its value is "061384".

- te_ptmplt, also a sting, is a template that shows how to display the data in te_ptext. Its value is "Enter Date: __/__/__".

- te_pvalid is a string of input validation characters. Its value is "999999".

- The editable text facility merges all the above data in one sting, "Enter Date: 06/13/84".

- If the user types "1004", the string becomes "Enter Date: 10/04/84".

- If the user presses the Backspace key after typing "1004", the string become "Enter Date: 10/0_/84".

- If te_ptext has no data or not enough data to fill out the template, the unfilled parts of the template show underscores

4170. C tutorial begins January 1st

Here is your chance to learn C!

Starting January 1st I will be posting lessons on about a biweekly basis on the C programming language. I will be concentrating on the basics of ANSI C, and will move on to Atari specific subjects if there is interest.

I will be using Laser C, but I don't think there will be many compiler specific issues. Nevertheless, I will help anyone who so desires, locate a copy of Laser C...

I plan on going over the basics for about 15 lessons, give or take, and then I will see what kind of interest there is in continuing.

MagiC registers a cookie called "MagX". The cookie value is a pointer to
the following structure (-> MAGX. H):

```
typedef struct
{
long config_status;
DOSVARS *dosvars;
AESVARS *aesvars;
} MAGX_COOKIE;
```

- config_status is the configuration bit-vector, which can be changed
using the configuration module MAGXCONT.CPX (or MAGXCONF.ACC).

- dosvars is a pointer to a DOSVARS structure:

```
typedef struct
{
char *in_dos; /* DOS semaphore
address */
int *dos_time; /* DOS time
address */
int *dos_date; /* DOS date
address */
long res1;
long res2;
long res3; /* alway 0L */
void *act_pd; /* current program
*/
long res4;
int res5;
void res6;
void res7; /* internal DOS
memory list */
void (*resv_intmem) (); /*
extends DOS memory */
long (*etv_critic)(); /*
etv_critic handler */
char *((*err_to_str)(char e)); /*
conv. error to text */
long res8;
long res9;
long res10;
} DOSVARS;
```

- aesvars points to an AESVARS structure:

```
typedef struct
{
long magic; /* must be
$87654321 */
void *membot; /* end of AES
variables */
void *aes_start; /* start address
*/
long magic2; /* is "MAGX"
*/
long date; /* date
ddmmyyyy */
void (chgres)(int res,int txt); /*chg.
resolution */
long (**shel_vector)(void); /* resident
desktop */
char *aes_bootdrv;
int *vdi_device; /* VDI driver used by AES
*/
void *reservd1;
void *reservd2;
void *reservd3;
int version;
int release;
} AESVARS;
```

These variables are read only.

OK, I cannot believe I have typed this much! I got that out of the Magic 2.0 manual.... also in the manual is a C routine which test whether Magic exists and also returns the version number. You can purchase a copy of magic from Toad at www.ataricentral.com

I hoped that I have been of some help!

-Robert

Well you may be, I am not?, I am discussing the programming language
someone would choose to use to make a game at this moment in time,
You may well prove that C is faster and more compatable, I don't
actualy dispute that, I say its NOT the game makers choice, the choice
does not have to be the fastest, it is maybe the most apt, especialy
for someone who has never programmed before and wants to make a game
for the ATARI,

>Most important part is here the speed of the resulting game (because the thread
>evolved to the arcade game type, and arcade games need smooth animations and
>fast response to user action, to accomplish that the language has to be fast.)

You seem pre-occupied with speed, I will say C is faster, there!
Happy!, but still it would not be most peoples choice to make a game
in if they have STOS to choose from, the advantages of using C do not
compensate having to use C, ie no one in there right minds is making
games in C, but lots of people are making them in STOS.....

> > WHAT!!!!!!! eh? what do you mean its the only thing it can be used
> > for, we went through this once and I proved you wrong once,

>I know, I was stating things a bit black white. STOS was primary written as an
>game programming language, and ofcourse, you can do other things with susch a
>language.

Official name is...."STOS The Game creator", however it has evolved
so much that it can no longer be compared with the original,

> > proving...yes?

>I will, I told you I will, so I will, is it so hard to believe what I am
>claiming? Or are you eager to get a better version of the game?

I have it, I have it :)

> >> allow you to show a too big screen and the game is also faster. In
> >> arcade games bigger and faster usually is better.

> > In YOUR opinion...

>Please tell me yours. Whats a good arcade game? It has to be fast and smooth,
>doesn't it?

But not neccasarilly bigger, maybe a status/life/objects etc bar is
needed, maybe it is such a game that big icons showing the above is
needed, maybe some other information has to be shown, as arcade type
games are usually aimed at younger children then tiny status bars are
out, so full screen games are not always a good idea, thus smaller is
better?

> > time, no problem....so me not including jagpad was because I havent
> > got one to test with, and NOT because of proc time as you suggest,
> > your wrong again,

>No, I am reading Jouystick cursor keys and you pad at the same time. You can

Well that is simply another way of doing it, I like the idea of a
menu, giving the user a setup screen ?

> > Why not wait until you have done it before you start telling everyone
> > how good you are ?

>Either I have to be called sneaky devil because I am not telling I was working

I explained that was a lighthearted saying :)

>on the game or I am salling vapor ware. My delemma is that I have to prove that
>C is better and at the same time I want to do a realy good game, not just a bit
>of a game just lloking like heartland, but a bit better like you ask. That will

I personally haven't dealt with Toad since I met the Troy's at an
Atari show several years ago. They had a bin full of 8-bit carts that
were selling for $10 a piece (even though you could find them
elsewhere at the show for a buck or two). Anyway, I found a rare cart
in there and when they saw me looking at it, Mrs. Troy literally
snatched it out of my hands from across the booth and rudely told me
it wasn't supposed to be in the bin! I'd never had someone do this to
me before or since, even with all the hostile people I've dealt with
at flea markets over the years, and I was quite pissed! There could
have been another way to tell me the stupid thing wasn't for
sale...Anyway, I appreciate that they support Atari after all these
years, but get real...they have always charged close to full retail
for EVERYTHING, since the very beginning. How the hell did they
survive this long dealing Atari wares when all the good vendors fell
by the wayside?

Just my 2 cents worth...

Greg

Ah, but in this case...is it not true that the system is devoted to only
the "child" process until you exit it?

Mind you, I'm no programmer..but I know that from time to time I run
across a program that launches another...such as the way Ant Mail opens
an external editor. Some programs ask the AES to open the application
(like later versions of Ant Mail), and this way your system is still free
to multi task...co-operative, or pre-emptive, and you can choose different
applications that may be running in the mean-time. Other programs will
launch it as a child application, and you're stuck there...all else
sleeping...until you finish and exit from the "child" process. I suppose
the better written programs will check to see what AES is loaded, and use
the best method for that system (isn't that what the cookie jar is for?).

: > calling application. I appreciate Andreas' comments of a while back that

:
: Why is functionality reduced ? Because others than MagiC's AES do not
: bring preemptive multitasking ? That is not MagiC's fault.

See above comments...
Some programs that don't tell the AES an application is open, or out-right
have the AES open it, severely limit your flexability as a user. A good
example is an experience I've had with using Oasis and NOS in Geneva.
Oasis does not tell the AES when it opens another program...hence, you
can't multi-task at all when one of these "child processes" are open.
In this case, I like to run NOS in the back ground, and use Oasis as an

online reader. When Oasis calls one of its many editors, everything else goes to sleep until that editor is closed! While the TCP/IP stack sleeps, the internet provider grows inpatient from a lack of activity and hangs up on me. A good example of an application that works well is Ant Mail...it will have the AES open your editor...hence I can write email, browse the web, do irc chat...and much more all at once and nothing sleeps while I'm using the Ant-Mail-launched-editor unless I tell it to!

I agree fully...
A top notch program will check to see what is the best method depending upon what it runs under. Geneva may recommend one way...MagiC another, and the many AES/TOS versions even another.

For your information, AES (with MagiC5) return 3.99 as AES-version too ;-)

The originally mentioned approach is precisely the reason why Andreas Kromke still could not increase the AES version number beyond 4.0, even though MagiC AES has lots of improvements compared to AES 4.x. MagiC AES lacks a few minor things, and because egg-heads think the AES version number tells them everything about what is there, a MagiC returning 4.x as a version number would not run programs by those people properly. If everybody used the proper method by calling appl_getinfo then MagiC AES could have an appropriate version number that is proportional to it's quality, or service, or whatever, probably 6.0 or 7.0 ;-)

The method you suggest here to find out about appl_getinfo's presence is not appropriate either. It's again checking version numbers, which - I say it again - is not the right way. You noticed the problem already : appl_getinfo is claimed to be there with AES 4.x and later, but MagiC AES has version 3.99 and yet has appl_getinfo.

The only proper way to find out if appl_getinfo is present, is calling appl_find ("?AGI"); this returns 0 instead of -1 if appl_getinfo is present. After this, all AES extra features should be found out via appl_getinfo ! And voila : You do not need the version number anymore.

Cheers Peter

Well, depends what you're a newbie on. If you're a newbie on programming, then you should refrain of trying to use any graphics features from the operating system, just going for text based programs. That saves you the trouble of bothering with 80 % of all those calls. Once you know the basics of programming well, you can move on.

If you're a firm programmer, just not knowing the Ataris operating system, then go first for the lower parts of it, that is all but the GEM part. Explore BIOS, XBIOS and GEMDOS, that will give you a decent number of system calls to start with and to which you can get used. Then move on to GEM programming (VDI and AES).

I agree for a newbie the operating system provides a vast number of calls, but it is exactly this what makes it flexible and powerful. If you think there aren't needed so many, ask an Xwindow programmer. Only for the graphics part of the operating system he must deal with five times as many calls !

> Are the small programs I can start with so I can get familiar with the

I'm not sure what you're talking about.

> Now I was wondering if there are any know standards in programming the
> Atari. Or do I have to find all possible libraries on the net and put them
> together to find out which functions are best to use?

As an english reference the Atari Compendium is a good choice. This is not a tutorial, however. For this, Tim Orens document "Professional GEM" can be recommended. It's quite good, however a little out-dated, so everything you read from the PROGEM document you should compare with the appropriate part from the Compendium. Reading both at the same time you'll get a fairly comprehensive picture of programming Ataris. PROGEM can be found on the net on many ftp-servers, and BBSs, to be printed, the Compendium is available from book stores. Proceed reading this newsgroup and you'll learn about the more recent aspects of Atari programming.

Cheers Peter

Oh noooo ! It's so buggy like all those early c compilers. It's
successor, the Laser C is not much better in that.

I'd suggest you go for some recent compiler. Turbo C was the first good
compiler. It's successor, Pure C is even better, and damn fast. If you
got the resources GNU C is a good choice too, and provides the C++
extensions, however compiling is slow. I heard late versions of Lattice
C are rather good too.

> really afford to buy any books on the subject)

The TEDINFO structure has three entries, te_ptmplt, te_pvalid, and
te_ptext, that are responsible for the strings. The te_ptmplt is a template
that shows the structure of the edit field, where in fact characters can
be edited on the screen. Fixed characters are here, and underscores show
where the user can edit a character. The fixed characters are omitted in
both te_pvalid and te_ptext, there are places only for the editable
characters ! The te_pvalid determines what sort of characters are allowed
at the corresponding place. A '9' for instance allows only digits. The
te_ptext contains the edited characters. This is the entry which is of
most interest here.

A good example is what I had the other day when working on STiK :
An edit field for an IP address was needed. An IP address is four numbers
between 0 and 255, separated by dots. The TEDINFO strings are :
te_ptmplt : "IP Address : ___.___.___.___"
te_pvalid : "999999999999"
te_ptext : "@___________"

You'll see the structure from the te_ptmplt. The underscores are the
places the cursor may roam about. For each of the underscores there is a
character in both te_pvalid and te_ptext : The character in te_pvalid (`9')
means only digits are allowed (as numbers are to be entered). The
te_ptext holds the finally entered characters. The `@' in the first
position of the te_ptext is a trick to have the field cleared and the
cursor in the first position when calling form_do, for instance.

Now form_do does all the work, and you only need to evaluate the te_ptext
string.

Don't do this. Although I'm confident that MagiC will survive it, you'll
want your program work with other AES too if they provide the same
radio/checkbox feature. It's so little work to put in a pointer that
points to a $0 byte, indicating an empty string.

Cheers Peter

There is a minor thing to distinguish which might have caused confusion
here. If you Pexec another program then GEMDOS knows that you (as a
process) want to start another process. This other process will be your
child then.

With shel_write things are slightly different. It is not your program
that starts another process, and it's not the desktop either. In fact,
your program asks the AES to launch the new process ! The AES do it, and
thus the new process is a child of the AES. This means that the new
process is not terminated if your process terminates, as you observed.
However, the new process will be terminated by force if the AES terminate !
Sure this is not possible with MagiC, but there are several AES that can
run with MiNT, for instance, and that can very well terminate. Those AES
are Geneva, NAES, XaAES, oAESis ...

With MagiC or MiNT you're not necessarily stuck when launching another
process using Pexec.

I guess what I wrote above clears up your confusion.

In the mid-80's when Atari was using the slogan "Power without the Price"
It was true. You couldn't buy a better system for the money. The problem
is that the prices on Atari hardware became stagnant, while hardware prices in
the PC world dropped rapidly. For instance, in 1992 Atari released the Falcon
'030 (1 meg, no HD) for $799. Today toad is still selling the MK-I falcons
with the same specs for... $799. In 1992, $799 might have bought you a 286
or 386 system with 1meg and a small HD if you were lucky. Now you can buy
a low-end Pentium-class machine with 16meg RAM and a 850meg (or better) HD.

Add-ons are similar. For over $150, you can take your 8mhz ST to 16mhz with
an Adspeed. For about $50 you can replace a 66mhz 486DX2 with a 133Mhz 5x86
CPU on a PC.

I would love to have an Atari clone that was as powerful as my PC (like one of those
Medusas or Hades machines) But at $3500 for what is equivalent to a slower
Pentium at best, I just can't afford it. :(

4192. Intro. to C tutorial, part 1

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-30 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19961230174500.MAA13314@ladder01.news.aol.com>
Source record: 8034

Welcome to the C programming tutorial!

This is the introduction to a continuing series. I have two specific goals for this series: to teach the C programming language and to demonstrate its use on Atari compatible computers. That is, to teach the constructs of C, which is portable accross a wide variety of platforms, and to demonstrate its use by creating real world applications for the Atari compatible.

--What is C? What is C++?

C has been around for a long time, but it was during the heydey of Atari, Amiga, and Macintosh when C really came into its own as the language of choice for developing applications. C's popularity is due to three key points. One, C is a structured language. That is, a C application can be broken down into smaller, more maneagable segments that can be written and tested seperately from the application as a whole. Two, C is portable. That is most of the code you write for your Atari application can be reused in applications that you may write for a different platform, like the pc. Only machine specific routines need to be rewritten. Thirdly, C programs tend to run faster than other languages.

C++ is in some respects an entirely different language than C. Over the years, however C and C++ have melded in function. You must know C to understand C++. Some people learning C++ learn C at the same time, however it is wise to learn C first, and thoroughly before moving on to C++. C++ is an object oriented programming (OOP) language.

--Should I learn C or BASIC first?

The fundamentals of programming, i.e. accepting input, manipulating data, formatting output, are universal regardless of which language you choose and learning any language will help you develop analytical skills that you will find useful in other environments. There are versions of BASIC available free for the Atari computer, whereas C usually costs money. It may be wise to start programming in BASIC to see how well you like programming, although C compilers are pretty inexpensive nowadays. C has the advantage of being far more portable, should you choose to develop programs for other environments. I believe there is a version of BASIC called STOS available for free download.

Message-ID: <19961230174700.MAA13355@ladder01.news.aol.com>
Source record: 8035

--OK, I want to learn C. What do I need?

You'll need an Atari compatible computer. That is any Atari made ST or TT, or Falcon, or a clone. There are clones such as the Medusa (www.compdirect.com) and the C-LAB Falcon (www.ataricentral.com). Or you can have a pc outfitted with an emulator, such as gemulator 96 (www.emulators.com). In addition you will need a C compiler. I will be using Megamax's Laser C. You can't go wrong with this compiler and I will sell you one for $40US + shipping if you cannot find one elsewhere. (Email: RDupuy5596@aol.com)

A printer would be a great help, although not mandatory. In addition you may wish to purchase additional reference material. Some great reference books are available from Bravo Sierra Computers.(www.teleport.com/~bensmith/bscomputrs.shtml)

--What is this 'compiler' that you are talking about?

C is a structured language, applications are built from many smaller segments. Many of these segments are prewritten. A compiler contains libraries of prewritten program segments for use in your own programs. A compiler will link these segments together to create the final application. In addition, a compiler will check your code for syntax errors (typos and other mistakes). The compiler will make the final executable so anyone, even someone who doesn't own C, can run your programs!

--I'm still confused. Is there any hope for me?

Probably not, but don't despair. :-) Starting on January 1st, and about every two weeks thereafter I will post a lesson. Depending upon the response, I will attempt to answer any question you may have. Please post to the group and don't Email me individually. This is because, one, someone else may have the same question and, two, someone else may have the answer!

----Robert Dupuy

4194. C Tutorial, Lesson 1, Extra Credit

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-30 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19961230205300.PAA17974@ladder01.news.aol.com>
Source record: 8036

EXTRA CREDIT

OK, you may add comments to any program by using the following format:

```
/* put comments here */
```

Got that? You type (without the quotes) "/*" to start a comment and a "*/" to end the comment.

The "/*" tells the compiler to ignore all text and the "*/" tells the compiler to stop ignoring text. Comments don't change the way your final program runs or the size of your final program in anyway, but they are usefull for making your long programs readable by other programmers or yourself. Here is the first.c, this time with comments

```
/*
This is my very first program
*/

#include <stdio.h> /* This is a header file. Header file's have the '.h'
extension */

/* Every C program has a function called 'Main' */

main() {
printf("My first program\n"); /*print my first program */
getchar(); /* Wait for return */
}
```

Of course in real life, you would not use this many comments. Comments that only state the obvious detract from readability and our goal is to make our code as readable as possible!

OK, compile this program, its exactly the same as the first! See, I told you....

Thats it for lesson one, in the next lesson we'll go over the format of C programs and what functions are all about.

p.s. always remember to end a comment with the '*/' . Its a common mistake to just start a new line without ending the comment. The compiler ignores all text untill it reaches a '*/' so if you leave one out, the compiler will ignore the rest of the program

Hi Folks.

I was wondering if any of you good Atarians have any experience of programming the 'Atari Way' using Magic PC. The reason I ask is that I've just got a PC, and unfortunately haven't got room for the old ST any more. If I absolutely MUST, I'll keep it, but only if some of my ST software won't run under Magic on the PC.

The software I'm interested in (for programming anyway) is :-

Lattive C 5.52
Personal Pascal 2.05 (using Everest as the editor)

FYI, I have been using these systems under Magic 2 and Ease 3 for a while, and although Lattice has some compatibility issues that I have come across (eg running Batcher from the Lattice editor), it seems to work OK.

Look forward to your reply's !

Cheers,

Drew ;^)

4197. C Tutorial, Lesson 1

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-30 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19961230205100.PAA17929@ladder01.news.aol.com>
Source record: 8039

LESSON ONE - Get To Know Your Compiler.

If you'll recall from the introduction, the compiler is central to making a C application. The compiler translates the english-like syntax of your program into a binary (1's and 0's) that the computer can execute. In addition, since most C programs are broken into several segments, the compiler will link these segments together and will do some rudimentary error checking.

There are two types of compilers available: those that use and IDE (integrated development environment) and command line compilers. Megamax LaserC (which is the primary compiler for this tutorial) is a good example of an IDE compiler. In an IDE environment, the editor (used for typing in the C programs) and other functions are built in a easy to use shell. Command line compilers tend to be a little more cryptic. With a command line compiler you use any text editor or word processor to write your code. Error checking is harder to do with command line compilers, and you may have to learn and understand how to use scripts to keep track of various modules. Alcyon C that comes with the Atari Developers Kit is an example of a command line compiler. I highly recommend that you do not use a command line compiler to learn C.

The goal of this lesson is to familiarize yourself with how your compiler works and you will type in your first C program. It will not be necessary to understand this program, only to type it in EXACTLY as written, and to compile it.

First, if you have not done so already install Laser C. (or whatever compiler you are using). Refer to your documentation for help. If you still cannot install your compiler then post to this group and someone will help you out.

Double click on the Laser C icon. This will load the Shell and ram resident programs. If you will be using a command line compiler then load a text editor. Select the File menu, then select New. In the window type the following EXACTLY (case is important):

```
#include <stdio.h>

main() {
printf("My first program\n");
getchar();
}
```

OK, now select the file menu again, and then select Save As. Save this file as First.C....

The file should now be saved to disk, you may change the name but be sure that it has the ".C" extension, this is necessary for your compiler to recognize it as a C program.. In Laser C, you may now pull down the Execute menu and select run. If you did not type any errors then Laser C will automatically compile and run the program. Hit return to exit the program. Now exit Laser C, you will find a program called First.prg on your disk. You may run the program again, if you'd like, just double click on it! (Remember to hit return to exit this program)

If you are using a command line compiler, please refer to the documentation. Command line compilers usually work by typing the name of the compiler followed by the program you wish to compile. Also there may be many options and several passes necessary to make them work. Please post to this group if you have questions about using your command line compiler.

bjr@edison.ebicom.net (Brian Roland) said:-

>Ah, but in this case...is it not true that the system is devoted to only
>the "child" process until you exit it?

Not necessarily. I can only talk about MagiC here ...

There are two types of child. There's a child launched by Pexec() and
a child launched by shel_write().

A Pexec() child will inherit the status of its parent but the parent
is suspended. If the parent was multitasking then the child will do
so, thus allowing other processes to continue. If the parent was
singletasking then the child will do also.

A shel_write() child is brought up as a separate process. All
processes remain running, including the parent. The only exception to
this is application zero (typically your installed desktop). It is
allowed to bring up processes singletasking. No other process can.

A singletasking process can spawn multitasking children.

So just about anything goes provided it does not interfere with other
processes.

Hmm, I just found the manual is wrong. You have to set bit15 ob_state
not ob_flags *and* also mask WHITEBAK (0x40) into ob_state, which
means you'll have to set up a keyboard shortcut also.

>Can I set the ob_spec field of the G_BUTTON to a null pointer if I do not
>want any text to be drawn beside the radio button or check box? (I don't
>have MagiC myself, so I can't test this.)

I have never tried it because there is no way to do it in my resource
editor. I think you'd be better off with a nul (ie '\0') string, or a
string of spaces though.

>Also, how much room should I allow for the button? Under Geneva, for
>example, an extra three characters are taken up with the button, so the
>object must be made three characters wider than the text.

That should work with MagiC as well.

4200. C Tutorial, Lesson 2

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-31 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19961231040000.XAA29215@ladder01.news.aol.com>
Source record: 7943

LESSON 2 - elements of a C program

OK, I'm going to keep things as simple as I can here.

Some elements of a C program are requirements that must be followed in
order to allow your compiler to work. Other elements are by tradition or
for readability and are not absolute design requirements.

Lets examine another sample program, its not necessary to understand
everything about it at this time:

```
/* Count.C */
/* This program will
count to 10 and
display the output */

#include <stdio.h> /* This header file defines printf() */

main() {
int count;

for (count=1; count<11; count++)

printf("\ncount=%d", count);
getchar();
}
```

```
/* Count.C */
/* This program will
count to 10 and
display the output */
```

A program starts with a comment that gives the filename and brief
description of the program.
If you'll remember from lesson one, comments are simply remarks that are
ignored by the compiler, but are useful reminders that aid other
programmers in their understanding of your code. A remark begins (without
the quotes) with a '/*' and must end with a '*/'

```
#include <stdio.h> /* This header file defines printf() */
```

The next portion of a C program is the preprocessor directives. These
are #include and #define. The preprocessor directives are for the
benefit
of the C compiler. The #include <stdio.h> tells the compiler that you
will be

using the stdio.h header file. This header file contains information
about the printf() function. Confusing? Don't worry I'm just trying to
give you an outline of a C program, we will cover header files again.

main() {

Remember, C is a structured language. That means you reuse code. over
and over.
Unlike languages such as BASIC, there are very few keywords in C. C is a
language
made up almost entirely of functions. Every C program contains a main()
function,
and by tradition main() goes first. Our example only has one function,
but in real life
C programs have many.

int count;

Initializes a variable 'count' and tells the compiler that it will be an
integer.

for (count=1; count<11; count++)

A for loop, don't worry about this just yet.

printf("\ncount=%d", count);

printf() is not a keyword! printf() is a function that is being called.
We do not have to
rewrite this function because it has already been written. The printf()
is in the header
file stdio.h which we told the compiler to use at the beginning of the
program.

getchar(); /* waits for the enter key before exiting */

getchar() is another function that is part of the stdio.h file.

}

Clear as mud now? Don't worry, I just wanted to familiarize you with the
makeup of a C program.
To Summarize: Start with some comments so you can remember what the
program is all about later, then you will do some preprocessor directives,
such as telling the compiler what header files you will be calling up in
your program (what prewritten routines you will be borrowing), then you
will write the function main() which contains the logic of your program.
Finally, you write any functions that
main() calls, but are not included in any header files(not necessary in
this tiny example, but done in real life)

4201. Re: STOS

Poor you, you have seen STOS being upgraded from utter crap to something that is usefull for writing games, but you are still stuck on the GEM idea of the eighties. Please set your gemulator to normal resolution (640x480 and at least 16 colors) get a mordern (German) GEM game and be stunned.

>> Can I make a game for a so called super computer? (including TT's)
>> No.
>
> I don't see this as much of a problem, I will be able to include TT
> by the next game I release as that has been sorted already, theres
> only madusa and hades I cannot support..so what ?

No, you don't see it as a problem, but someone who wants to develop for those super computers does when he wants to use STOS (maybe because he heard in this newsgroup that it is supposed to be the best language for games?).

>> Will my game work on a not yet released TOS version? No.
>
> YES!....Give us a new TOS version and it will be fixed for it just
> like all the rest have ?

So, the answer is no. The TT and the STe are about the same age. It took STOS support over five years to fix it for a TT. Did you cover all TOS versions? There are at least 2! Are there important differences between the German, French and UK versions of the TT TOS? Who can tell?
The Phenix project is trying to make a free TOS version with sources freely available. It's impossible to fix STOS for every diferent compilation of such a TOS version.
The only solution is to fix STOS so it looses it's nasty habit to use fixed adresses.

> I do not recall ever saying STOS was faster than C, I would never say
> such a thing, I have stated STOS is the better choice for making
> games, not that it is faster?,

What about that quotation from Uwe Haase. ('C can't handle anything that needs speed, timing and power' or something like that, the message has already been whased away be new messages.)

>> It isn't working on the TT too. Useless? Please let the programmer
>> decide on
>
> the next game (according to the author of the generic fixer) will be
> able to work on a TT, it will also work on a falcon without the use
> of backwards, by having code inserted that will set the machines to
> 8mhz and atari st low :)

Forget the point about 8 MHz. (You can't set a Falcon to 8 mhz (to say in words 8 milli Hertz).) If your game is supposed to work in 1 vbl then simply wait forthe next vbl when you are done with prparing the next screen, no problem. But when it is supposed to work in 2 vbls like heartland, then make sure it always uses those 2 vbls, even on faster machines. You can keep track of the number of vbls by reading _vbclock, a system variable that counts the number of verical blanks sice system start. You can read it by lpeek($462). A routine waiting for the second vbl could look like this (it's not exactly STOS basic, not C, not Omikron basic but just a discription that should easily be ported to any programming language).

```
if(lpeek($462) & 1) then ' we are doing a bitwise and overhere
' ie (13 & 7) = 5
Vsync() ' wait for a vertical blank
endif

temp=workscreen
workscreen=displayscreen
display=screen=temp ' swap workscreen and display screen

Setscreen(workscreen, displayscreen, -1)
' workscreen is now the logic screen
' display screen the physic
Vsync() ' wat for a vertical blank
```

This code will wait an extra vertical blank if there is an odd number of vertical blanks in the counter.

>> Please explain me why... You don't have to use GEM, you CAN use GEM.
>> The choise is to the programmer.
>
> There you are, I didn't know that?, and the knitting class say this
> thread is none informative :)

Ai, you could have known that, you have a program of mine that hasn't got any Gem init it, although it was written in C! (There a lots of people asking me for a Gem interface to that program.)

>> How fast do you want to display your background sprites?
>
> NOT so fast that it spoils the game ?

High speed background drawing won't spoil the game, bad timing will.

>> Yes it is, I was thinking about a lot of GEM stuff and so on, maybe
>> even a compression program?

>
> Like my picture compactor currently used by ST+ diskzine and a couple
> of personalized programs made on request, people like my picture
> compactor because it is soooo fast :),

Wow, please tell me:
1 is compression fast or only decompression? (Decompression time is the only thing that matters though)
2 what compression algorithm are you using? (Run length encoding is my guess)
3 ratios, what is its ratio? (Let us use the intro picture from heartland as a example picture (in degas PI1 format).)
4 what is the size of the decompression program? (a picture compressor requiering a 2Mb decompression engine is of no use for ST games :-))

(BTW: my results are 7413 bytes for the 1kb decompression routine and 8245 bytes for the 144 byte decompression routine, speed: beats atomic, ice and sentry packer :-) Compression and decompression routines are available in C but for the sake of speed and size I recommend the assembley versions.)

> Hans please stop insisting STOS cannot do certain things, I then have
> to start listing them all, again and again, you must concede that
> STOS can do a lot more than make games.....

Ofcourse, I think that you, as a experienced STOS programmer, can do almost anything with at as long as it doesn't need GEM or compatibility with 'super computers'.

I think less suitable is a better discription.

>> eeerm again, so what? what is so good about that? it doesent seem to

>>
>> Well, I designed some routines for heartland. I might put those
>> together in a library for next time use?
>
> AND ? so what...I have made a few platformers, didnt need C libraries
> ?

I think that you have to experience advantages like that to appreciate them, they are not highly necesarry, but make the live of the programmer easy.

> a game for the ATARI,

When choosing a programming language becomes a matter of taste there is no discussion possible. We can only discuss advantages and disadvantages of certain programming languages. Saying the best for games does IMHO say nothing of someone just getting started in (game) programming, to me its about speed, speed and more speed (thinking about arcade games right now, we covered all other types of games).

> You seem pre-occupied with speed, I will say C is faster, there!
> Happy!, but still it would not be most peoples choice to make a game
> in if they have STOS to choose from, the advantages of using C do not
> compensate having to use C,

Yes, you have first to learn programming before you can switch to C. It's clearly a language for advanced programmers. It's an incredible powerfull language that will hapily carsh if you made a mistake.

> ie no one in there right minds is making
> games in C, but lots of people are making them in STOS.....

Yes, and the mayority is right aren't they? They are going for the easy way to make games, but the easy way isn't the best way. Again, the easy way to make games is to use the programming language you already know, no discussion possible.

>> I will, I told you I will, so I will, is it so hard to believe what I

But heartland could get bigger without loosing information. And even with fulls
creen games you can simpley overlay the status bar on the screen?

>> No, I am reading Jouystick cursor keys and you pad at the same time.
>> You can
>
> Well that is simply another way of doing it, I like the idea of a
> menu, giving the user a setup screen ?

No, I don't like those things, it then either use this or that, when no
limitations are necesarry simple support them all without forcing the user to
select the joystick of choise first.

> comments to follow........

I will be waiting for them.

Now signing of for this year, although there are some more messages to be
answered, they have to wait to 1997.

So to all readers of COMP.SYS.ATARI.PROGRAMER:

Happy newyear! May the Powers in the Clouds guide you safely on your quest
through the lonely desert, haunted by Evil User Requests and fearsome Bugs.

Hans Wessels

So let me see if I've got this correct.

I'm finding out the address of the te_ptext by using rsrc_gaddr()

Is the address returned by doing this the actual address of the text
or does the returned address just hold the address of the text?

--OK, I want to learn C. What do I need?

You'll need an Atari compatible computer. That is any Atari made ST or TT, or Falcon, or a clone. There are clones such as the Medusa (www.compdirect.com) and the C-LAB Falcon (www.ataricentral.com). Or you can have a pc outfitted with an emulator, such as gemulator 96 (www.emulators.com). In addition you will need a C compiler. I will be using Megamax's Laser C. You can't go wrong with this compiler and I will sell you one for $40US + shipping if you cannot find one elsewhere. (Email: RDupuy5596@aol.com)

A printer would be a great help, although not mandatory. In addition you may wish to purchase additional reference material. Some great reference books are available from Bravo Sierra Computers.(www.teleport.com/~bensmith/bscomputrs.shtml)

--What is this 'compiler' that you are talking about?

C is a structured language, applications are built from many smaller segments. Many of these segments are prewritten. A compiler contains libraries of prewritten program segments for use in your own programs. A compiler will link these segments together to create the final application. In addition, a compiler will check your code for syntax errors (typos and other mistakes). The compiler will make the final executable so anyone, even someone who doesn't own C, can run your programs!

--I'm still confused. Is there any hope for me?

Probably not, but don't despair. :-) Starting on January 1st, and about every two weeks thereafter I will post a lesson. Depending upon the response, I will attempt to answer any question you may have. Please post to the group and don't Email me individually. This is because, one, someone else may have the same question and, two, someone else may have the answer!

----Robert Dupuy

(***p.s.***) I am brand new at this, and appreciate any help anyone may wish to offer.

I use Gemulator with Magic 2...but I do Atari programming on my pc using Laser C..

I've heard good things about Lattice 5.6 and will probably try that out when I get the funds...

As for Laser C, it does work on the pc, but you must set Gemulator to Atari Disk Mode...I am not sure why this should be a requirement, but it will not work otherwise.

Good Luck, and have a happy new year.

I know not the people of which you speak, but as a business man myself,
I would suggest that the answer to your query lies in the question.

They charge what the market will bear, and in so doing maintain the
viability of their endeavour. Or to turn it the other way round, the
ones you like because they charge less disappear because in keeping
you happy they are themselves unviable in the long term.

Message-ID: <19961230174500.MAA13314@ladder01.news.aol.com>

Welcome to the C programming tutorial!

This is the introduction to a continuing series. I have two specific goals for this series: to teach the C programming language and to demonstrate its use on Atari compatible computers. That is, to teach the constructs of C, which is portable accross a wide variety of platforms, and to demonstrate its use by creating real world applications for the Atari compatible.

--What is C? What is C++?

C has been around for a long time, but it was during the heydey of Atari, Amiga, and Macintosh when C really came into its own as the language of choice for developing applications. C's popularity is due to three key points. One, C is a structured language. That is, a C application can be broken down into smaller, more maneagable segments that can be written and tested seperately from the application as a whole. Two, C is portable. That is most of the code you write for your Atari application can be reused in applications that you may write for a different platform, like the pc. Only machine specific routines need to be rewritten. Thirdly, C programs tend to run faster than other languages.

C++ is in some respects an entirely different language than C. Over the years, however C and C++ have melded in function. You must know C to understand C++. Some people learning C++ learn C at the same time, however it is wise to learn C first, and thoroughly before moving on to C++. C++ is an object oriented programming (OOP) language.

--Should I learn C or BASIC first?

The fundamentals of programming, i.e. accepting input, manipulating data, formatting output, are universal regardless of which language you choose and learning any language will help you develop analytical skills that you will find useful in other environments. There are versions of BASIC available free for the Atari computer, whereas C usually costs money. It may be wise to start programming in BASIC to see how well you like programming, although C compilers are pretty inexpensive nowadays. C has the advantage of being far more portable, should you choose to develop programs for other environments. I believe there is a version of BASIC called STOS available for free download.

We are a new site on the internet and we can supply your
hardware needs. As a promotion to get our name out to you, we are
running a special promotion on 32Meg simms. For a very limited time,
we are selling 32Meg/70ns EDO simms for just 140+shipping and handling,
delivered to your door within 2-3 days.

Just go to our site www.bytewarecafe.com and fill out the necessary
information about yourself and your credit card information. Goto the
products list and choose the memory item. From here, select the memory
you want and click on the invoice button to see your total charges.

If you wish to browse the other hardware categories, feel free to browse for
as long as you wish. If you wish to buy anything else, just select that item
from that category.

If you are satisfied with your selection(s) and your personal information
is correct, click on the submit order button. The bytewarecafe.com
server will respond with an order number and a time stamp. You will
need these two numbers for any future correspondences with bytewarecafe.com

Your order will be prepared and delivered to your door within 2-3 days.

Thank you.

4214. C Tutorial, Lesson 3 1 of 4

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-31 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19961231232500.SAA24109@ladder01.news.aol.com>
Source record: 7957

LESSON 3 - printf()

First, a personal aside.

I am using America Online to connect to the internet and anything that I try to post longer than a page will cause a disconnect, so I am going to have to keep splitting up these lessons. Which means, inevitably someone will find themselves missing a part. In addition, some newsgroup servers are so pressed for space that some articles do not last very long. If you need a repost..let me know.

Also, I realize that the example C programs that I have use probably still look like a bunch of gibberish, but don't let that get you down. Like any language things will become more and more familiar to you in time, untill eventually you will wonder why you ever thought it was hard.

I thought long and hard about what the lesson plan should be today. Its a common fault of most tutorials to get bogged down with text formattting issues. Text formatting is great for understanding legacy applications, but not necessarily as important for programming a GUI (Graphical User Interface) environment like GEM.

Nevertheless, the GEM AES (Application Environment Services) will have to wait for more advanced lessons. So lets tackle printf() now, so we can begin programming today and so we can use it to display output as we continue learning the syntax of the C language.

As I mentioned in earlier lessons, printf() is not a C keyword, but a prewritten piece of code which is contained in virtually every C library. To be precise, it is contained in the header file stdio.h. (STanDard Input/Output) It is an output function.

(End part 1 of 4)

4215. C Tutorial, Lesson 3 part 2 of 4

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-31 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19961231232700.SAA24162@ladder01.news.aol.com>
Source record: 7958

--How do I recognize a function?

Good question. Every function from the main() function to the most obscure is always the functions name followed by a set of parenthesees. Sometimes there is information inside the parentheseees, such as:

printf("Print this");

the information in the parenthesees is passed to the function. In later lessons, we will cover in greater detail how information is passed to and from functions. For now, just remember when you use printf() you are calling a function, and information you place between the parentheseees is information you are passing to this function, which it will interpret and use to display information on your screen.

In the above example we are passing one argument. This arguement is the STRING CONSTANT "Print this"...we can pass more than one arguement to printf(). Consider the following example:

printf("My name is: %s","Robert");

within a C program, this would display:

My name is Robert

Why? Because %s is a FORMAT SPECIFIER. This tells printf() where to put a value and what kind of value to expect. %s tells it to look for a string. In this example the string is "Robert"

Lets take a look at another format specifier.

printf("I make %d per week",250);

This would display

I make 250 per week

4216. C Tutorial, Lesson 3, part 3 of 4

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-31 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19961231232900.SAA24244@ladder01.news.aol.com>
Source record: 7959

Why? because %d is a format specifier for a decimal integer value. It takes whatever is on the right of the comma and plugs it into the string on the left. Lets combine the previous two examples.

```
printf("My name is %s. I make %d per week.","Robert",250);
```

What would this display?

In the above examples using format specifiers doesn't make much sense. It would be easier just to type out a string constant such as "My name is Robert. I make 250 per week" But remember, these are just examples, format specifiers do come in handy. Lets take another look at that Count.C program from Lesson 2 and see if it makes any more sense now!

```
/* Count.C */
/* This program will
count to 10 and
display the output */

#include <stdio.h> /* Header file where printf() is located */

main() {

int count;

for (count=1; count<11; count++)

printf("\ncount=%d",count);
getchar();
}
```

If we examine the printf() function call here, we can now see that the value of count is substituted for '%d' We can also see a '\n' that is not printed when we run the program. That is because \n tells the printf() to start a new line. In typewriter speak, it technically does a carriage return and a line feed.

For extra credit. Delete the \n from the above program and recompile and re-run it.

As it turns out, the radio buttons and check boxes should be G_BUTTON with
ob_flags bit 15 set. If the object has the radio button flag set then
a radio button will be drawn.

There is no object type of "radio_button" or "check_box".

I was wanting to check for the presence of MagiC so that I can use MagiC style radio buttons and check boxes when MagiC is present.

How should I be using appl_getinfo to determine whether MagiC style radio buttons and checkboxes are present? I was unable to find a mode which returned this information. (By "MagiC style readio buttons" I am referring to a G_BUTTON object with ob_flags bit 15 set.)

OTOH, I will only be using this with MagiC. If an other AES supports the same feature, how would I know about it in order to use it? You mentioned previously about using appl_getinfo to find out, but I cannot find an appl_getinfo mode which returns the relevant information.

For example, Geneva supports the same feature, but it uses "extended type" 18 to indicate a radio button or checkbox. So I have to use individual support for each AES anyway.

4220. C Tutorial, Lesson 3, part 4 of 4

Newsgroup: comp.sys.atari.programmer
Date: 1996-12-31 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19961231233100.SAA24334@ladder01.news.aol.com>
Source record: 7963

Here is your assignment: Using format specifiers write a program, that states your name, age, and weight, on three lines. Use only one printf() call.

To help you out here is a template for your program.

```
/* NAMEOFPROGRAM.C */
/* THIS PROGRAM DOES SOMETHING */

#include <stdio.h> /* You must use this preprocessor directive, because
it contains the printf() function */

main() { /* the starting bracket tells the compiler where the main
function begins */

LOGIC GOES HERE

getchar(); /* This waits for a return, so you have time to
read the output before the program ends */

} /* Don't forget the ending bracket, the compiler needs to know where
the main function ends too! */
```

Have you all been running into compiler errors? I'm sure you have! I have! Forgetting a quote or a semi-colon gives the compiler fits doesn't it? C is a very exacting language when it comes to syntax, but that is in part why it produces such great code!

oh yes, one other thing, the compiler strips out spaces, all the indentations are for readability and are traditional, they are not absolutely necessary.

Why? because %d is a format specifier for a decimal integer value. It takes whatever is on the right of the comma and plugs it into the string on the left. Lets combine the previous two examples.

```
printf("My name is %s. I make %d per week.","Robert",250);
```

What would this display?

In the above examples using format specifiers doesn't make much sense. It would be easier just to type out a string constant such as "My name is Robert. I make 250 per week" But remember, these are just examples, format specifiers do come in handy. Lets take another look at that Count.C program from Lesson 2 and see if it makes any more sense now!

```
/* Count.C */
/* This program will
count to 10 and
display the output */

#include <stdio.h> /* Header file where printf() is located */

main() {

int count;

for (count=1; count<11; count++)

printf("\ncount=%d",count);
getchar();
}
```

If we examine the printf() function call here, we can now see that the value of count is substituted for '%d' We can also see a '\n' that is not printed when we run the program. That is because \n tells the printf() to start a new line. In typewriter speak, it technically does a carriage return and a line feed.

For extra credit. Delete the \n from the above program and recompile and re-run it.

For Pure C, you will first need to specify a Project File. Use the DEFAULT.PRJ file provided (use the Project/Select... menu item).

You might also need to specify the default directories where the headers and object libraries are located. I believe it works OK straight out of the box, though.

```
LESSON 2 - elements of a C program

OK, I'm going to keep things as simple as I can here.

Some elements of a C program are requirements that must be followed in
order to allow your compiler to work. Other elements are by tradition or
for readability and are not absolute design requirements.

Lets examine another sample program, its not necessary to understand
everything about it at this time:

/* Count.C */
/* This program will
count to 10 and
display the output */

#include <stdio.h> /* This header file defines printf() */

main() {
int count;

for (count=1; count<11; count++)

printf("\ncount=%d", count);
getchar();
}

-----------------------------------------

/* Count.C */
/* This program will
count to 10 and
display the output */

A program starts with a comment that gives the filename and brief
description of the program.
If you'll remember from lesson one, comments are simply remarks that are
ignored by the compiler, but are useful reminders that aid other
programmers in their understanding of your code. A remark begins (without
the quotes) with a '/*' and must end with a '*/'
```

4228. Repost, Lesson 2, part 2

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-01 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19970101020700.VAA28465@ladder01.news.aol.com>
Source record: 7969

```
#include <stdio.h> /* This header file defines printf() */

The next portion of a C program is the preprocessor directives. These
are #include and #define. The preprocessor directives are for the
benefit
of the C compiler. The #include <stdio.h> tells the compiler that you
will be
using the stdio.h header file. This header file contains information
about the printf() function. Confusing? Don't worry I'm just trying to
give you an outline of a C program, we will cover header files again.

main() {

Remember, C is a structured language. That means you reuse code. over
and over.
Unlike languages such as BASIC, there are very few keywords in C. C is a
language
made up almost entirely of functions. Every C program contains a main()
function,
and by tradition main() goes first. Our example only has one function,
but in real life
C programs have many.

int count;

Initializes a variable 'count' and tells the compiler that it will be an
integer.

for (count=1; count<11; count++)

A for loop, don't worry about this just yet.

printf("\ncount=%d", count);

printf() is not a keyword! printf() is a function that is being called.
We do not have to
rewrite this function because it has already been written. The printf()
is in the header
file stdio.h which we told the compiler to use at the beginning of the
program.

getchar(); /* waits for the enter key before exiting */

getchar() is another function that is part of the stdio.h file.

}
```

Clear as mud now? Don't worry, I just wanted to familiarize you with the makeup of a C program.
To Summarize: Start with some comments so you can remember what the program is all about later,
then you will do some preprocessor directives, such as telling the compiler what header files you
will be calling up in your program (what prewritten routines you will be borrowing), then you will write
the function main() which contains the logic of your program. Finally, you write any functions that
main() calls, but are not included in any header files(not necessary in this tiny example, but done in real life)

4229. Does anyone need reposts for Intro- Lesson 3

OK,

Hopefully everyone has the following parts:

Intro
Lesson 1
Lesson 2
Lesson 3

I am working on Lesson 4 now, but I may pause for a bit to make sure everyone who is interested has got all the lessons...I know some of you are still searching out a compiler. I don't think any two people are using the same compiler, but if everyone gets to the end of Lesson 3 feeling fairly comfortable then I think we can move ahead without any hitches...

By the way, feel free to copy these articles, modify them, do anything with them you'd like ... except claim that you wrote them you stinkin bastard...

ooops, got a bit carried away there, ha! :-) Seriously, do whatever you'd like with them, I'm just writing these for my own edification and would love it if more people found them useful.

Happy New Year to All!

> I'm finding out the address of the te_ptext by using rsrc_gaddr()

> Is the address returned by doing this the actual address of the text
> or does the returned address just hold the address of the text?

Given code of the form:

```
TEDINFO *tip; /* TedInfo Pointer */

rsrc_gaddr( R_TEDINFO, itemnum, &tip ); /* get address of TEDINFO structure
associated with TEDINFO #itemnum */
```

This call is useless, as it (and R_TEPTEXT, R_TEPTMPLT and R_TEPVALID)
will not work as they requies the TEDINFO item number within the whole
TEDINFO block in the resource file. This itemnum is not returned by most
(all?) resource editors I know of.

Instead you need to use something of the form:

```
OBJECT *tree;

rsrc_gaddr( R_TREE, treenum, &tree ); /* get treee pointer */
tip = (TEDINFO *)tree[itemnum].ob_spec;
```

This will load tip with the address of the TEDINFO structure within that
tree.

You can then get at the te_pvalid, te_ptext &c via "tip -> te_ptext" &c.

Wow, lovely discussion.

I'd like to ad a point. I use Gemulator and I cannot run any STOS games so far :-(

I initially thought I would not have any problems running games because Megaroids (written as a demo for the original Megamax C) works just fine.

This has just been my experience so far, but since my Atari ST, (TOS on disk!, its been that long...) was thrown away by my evil brother, who was looking after it...

Gemulator is all I have! And when I buy a real Atari Machine, it will probably be one of those high end systems....

If I had a real ST, I would probably be very glad for STOS, since apparrantly it has spurned the creation of many exciting games, but since I do not, I have to vote with the C crowd. Has anyone run the new Heartland through Gemulator? If it works let me know, I'd like to play it!

4232. Form CPX dialog size?

What is the size of a Form CPX dialog? For example: 304 by 152 pixels.

(Sods law says that the hypothetical numbers I have just quoted from the top of my head have just correctly answered my question)

I used to have it written down somewhere, but no longer seem to have it available.

I looked in the Compendium, but it appears to mention nothing on this subject.

Is there a good source of info on this subject?

```
d > I'm finding out the address of the te_ptext by using rsrc_gaddr

Actually, the index used to specify the TEDINFO may be difficult to
locate (unless the RSC has only one). One usually accesses it via
the ob_spec pointer:

OBJECT *tree;
char *p;

rsrc_gaddr(R_TREE,T_NAME,&tree);
p = tree[O_NAME].ob_spec.tedinfo->te_ptext; /* Pure C */
or
p = ((TEDINFO*) tree[O_NAME].ob_spec)->te_ptext; /* Laser C */

where T_NAME and O_NAME represent the names you gave the tree and
object in your RSC editor (and defined in a header file provided).

It should...BUT....

STOS itself, the programming language does work under Gemulator,
therefore programs made should also work, if you have the rom cards
206 then everything should work fine, however if you are using a tos
image then its very doubtfull, also if you are using gemulator and
magiC then its also doubtfull as thats a different operating system,

HTH :)

Thanks for the C code for this but unfortunately (as I stated in the
original posting) I'm using assembler and I do not know enough C to
work out what is happening in the above.

Toad is about the ONLY company tha still regards Atari computers as real computers. Most of you guys still think of Atari as nothing more than a game platform and sell them as a simple game server. Its the users of Atari computers who have driven the prices down in private sales. A guy buys a 1040 for $700 and a few years later nobody will pay more than $50 for it. C'mon now folks, the hardware is much better than that. These are REAL computers, not nintendos.

Toad recognizes this fact and sells their stuff as real computers. They also stand behind their sales if something goes wrong. Toad currently sells a 1 meg 1040 for $199 and thats a very good and realistic price, but if a guy advertised one here for sale as an owner looking to sell his stuff, most of you would say thats too much for a 1040. SO admit it folks, either you have real computers or nintendos for sale in this group. I say that Atari made real computers and I bought them as such and will sell them as such when the time comes.

Tony-

I posted Lesson 2 in one big part...before I ever posted Lesson 3(4 parts)...however it seems that most people did not get Lesson 2, even though it is on the America Online newsgroup server OK... America Online keeps dropping the connection if I try to send out the lessons in one big message...so I have been forced to split them up...when I reposted Lesson 2, I split them up into two parts.

I like the idea of posting these lessons to the Newsgroup, so I will continue. In the future I will split up the pages and each page will be clearly marked (i.e. Lesson 4 page 1 of 4, etc.) AND I will post on the day when I said I was going to post the lesson so that people will have a chance to get them before the newgroup servers loses them. Btw, the AOL newsgroup server keeps about 350 msgs for this newsgroup, is this similar to your experience??

I will get back to you through Email on your other questions...

Subject: Intro. to C tutorial, part 1
From: rdupuy5596@aol.com (RDupuy5596)
Date: 30 Dec 1996 17:47:14 GMT
Message-ID: <19961230174500.MAA13314@ladder01.news.aol.com>

Welcome to the C programming tutorial!

This is the introduction to a continuing series. I have two specific goals for this series: to teach the C programming language and to demonstrate its use on Atari compatible computers. That is, to teach the constructs of C, which is portable accross a wide variety of platforms, and to demonstrate its use by creating real world applications for the Atari compatible.

--What is C? What is C++?

C has been around for a long time, but it was during the heydey of Atari, Amiga, and Macintosh when C really came into its own as the language of choice for developing applications. C's popularity is due to three key points. One, C is a structured language. That is, a C application can be broken down into smaller, more maneagable segments that can be written and tested seperately from the application as a whole. Two, C is portable. That is most of the code you write for your Atari application can be reused in applications that you may write for a different platform, like the pc. Only machine specific routines need to be rewritten. Thirdly, C programs tend to run faster than other languages.

C++ is in some respects an entirely different language than C. Over the years, however C and C++ have melded in function. You must know C to understand C++. Some people learning C++ learn C at the same time, however it is wise to learn C first, and thoroughly before moving on to C++. C++ is an object oriented programming (OOP) language.

--Should I learn C or BASIC first?

The fundamentals of programming, i.e. accepting input, manipulating data, formatting output, are universal regardless of which language you choose and learning any language will help you develop analytical skills that you will find useful in other environments. There are versions of BASIC available free for the Atari computer, whereas C usually costs money. It may be wise to start programming in BASIC to see how well you like programming, although C compilers are pretty inexpensive nowadays. C has the advantage of being far more portable, should you choose to develop programs for other environments.

Subject: Intro. to C tutorial, part 2
From: rdupuy5596@aol.com (RDupuy5596)
Date: 30 Dec 1996 17:49:03 GMT
Message-ID: <19961230174700.MAA13355@ladder01.news.aol.com>

--OK, I want to learn C. What do I need?

You'll need an Atari compatible computer. That is any Atari made ST or TT, or Falcon, or a clone. There are clones such as the Medusa (www.compdirect.com) and the C-LAB Falcon (www.ataricentral.com). Or you can have a pc outfitted with an emulator, such as gemulator 96 (www.emulators.com). In addition you will need a C compiler. I will be using Megamax's Laser C. You can't go wrong with this compiler and I will sell you one for $40US + shipping if you cannot find one elsewhere. (Email: RDupuy5596@aol.com)

A printer would be a great help, although not mandatory. In addition you may wish to purchase additional reference material. Some great reference books are available from Bravo Sierra Computers.(www.teleport.com/~bensmith/bscomputrs.shtml)

--What is this 'compiler' that you are talking about?

C is a structured language, applications are built from many smaller segments. Many of these segments are prewritten. A compiler contains libraries of prewritten program segments for use in your own programs. A compiler will link these segments together to create the final application. In addition, a compiler will check your code for syntax errors (typos and other mistakes). The compiler will make the final executable so anyone, even someone who doesn't own C, can run your programs!

--I'm still confused. Is there any hope for me?

Probably not, but don't despair. :-) Starting on January 1st, and about every two weeks thereafter I will post a lesson. Depending upon the response, I will attempt to answer any question you may have. Please post to the group and don't Email me individually. This is because, one, someone else may have the same question and, two, someone else may have the answer!<<<---Do to the limitations of usenet, I have changed my mind you may Email me individually(01/01/97)

4244. Repost, C Tutorial Lesson 1, 1 of 2

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-01 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19970101220600.RAA22643@ladder01.news.aol.com>
Source record: 7985

LESSON ONE - Get To Know Your Compiler.

If you'll recall from the introduction, the compiler is central to making a C application. The compiler translates the english-like syntax of your program into a binary (1's and 0's) that the computer can execute. In addition, since most C programs are broken into several segments, the compiler will link these segments together and will do some rudimentary error checking.

There are two types of compilers available: those that use and IDE (integrated development environment) and command line compilers. Megamax LaserC (which is the primary compiler for this tutorial) is a good example of an IDE compiler. In an IDE environment, the editor (used for typing in the C programs) and other functions are built in a easy to use shell. Command line compilers tend to be a little more cryptic. With a command line compiler you use any text editor or word processor to write your code. Error checking is harder to do with command line compilers, and you may have to learn and understand how to use scripts to keep track of various modules. Alcyon C that comes with the Atari Developers Kit is an example of a command line compiler. I highly recommend that you do not use a command line compiler to learn C.

The goal of this lesson is to familiarize yourself with how your compiler works and you will type in your first C program. It will not be necessary to understand this program, only to type it in EXACTLY as written, and to compile it.

First, if you have not done so already install Laser C. (or whatever compiler you are using). Refer to your documentation for help. If you still cannot install your compiler then post to this group and someone will help you out.

Double click on the Laser C icon. This will load the Shell and ram resident programs. If you will be using a command line compiler then load a text editor. Select the File menu, then select New. In the window type the following EXACTLY (case is important):

```
#include <stdio.h>

main() {
printf("My first program\n");
getchar();
}
```

OK, now select the file menu again, and then select Save As. Save this file as First.C....

The file should now be saved to disk, you may change the name but be sure that it has the ".C" extension, this is necessary for your compiler to recognize it as a C program.. In Laser C, you may now pull down the Execute menu and select run. If you did not type any errors then Laser C will automatically compile and run the program. Hit return to exit the program. Now exit Laser C, you will find a program called First.prg on your disk. You may run the program again, if you'd like, just double click on it! (Remember to hit return to exit this program)

If you are using a command line compiler, please refer to the documentation. Command line compilers usually work by typing the name of the compiler followed by the program you wish to compile. Also there may be many options and several passes necessary to make them work. Please post to this group if you have questions about using your command line compiler.

Source record: 7986

```
EXTRA CREDIT

OK, you may add comments to any program by using the following format:

/* put comments here */

Got that? You type (without the quotes) "/*" to start a comment and a
"*/" to end the comment.

The "/*" tells the compiler to ignore all text and the "*/" tells the
compiler to stop ignoring text. Comments don't change the way your final
program runs or the size of your final program in anyway, but they are
usefull for making your long programs readable by other programmers or
yourself. Here is the first.c, this time with comments

/*
This is my very first program
*/

#include <stdio.h> /* This is a header file. Header file's have the '.h'
extension */

/* Every C program has a function called 'Main' */

main() {
printf("My first program\n"); /*print my first program */
getchar(); /* Wait for return */
}

Of course in real life, you would not use this many comments. Comments
that only state the obvious detract from readability and our goal is to
make our code as readable as possible!

OK, compile this program, its exactly the same as the first! See, I told
you....

Thats it for lesson one, in the next lesson we'll go over the format of C
programs and what functions are all about.

p.s. always remember to end a comment with the '*/' . Its a common
mistake to just start a new line without ending the comment. The compiler
ignores all text untill it reaches a '*/' so if you leave one out, the
compiler will ignore the rest of the program!
```

4246. Repost, C Tutorial Lesson 2, 1 of 2

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-01 00:00:00 UTC

Message-ID: <19970101220900.RAA22703@ladder01.news.aol.com>
Source record: 7987

```
LESSON 2 - elements of a C program

OK, I'm going to keep things as simple as I can here.

Some elements of a C program are requirements that must be followed in
order to allow your compiler to work. Other elements are by tradition or
for readability and are not absolute design requirements.

Lets examine another sample program, its not necessary to understand
everything about it at this time:

/* Count.C */
/* This program will
count to 10 and
display the output */

#include <stdio.h> /* This header file defines printf() */

main() {
int count;

for (count=1; count<11; count++)

printf("\ncount=%d", count);
getchar();
}

-----------------------------------------

/* Count.C */
/* This program will
count to 10 and
display the output */

A program starts with a comment that gives the filename and brief
description of the program.
If you'll remember from lesson one, comments are simply remarks that are
ignored by the compiler, but are useful reminders that aid other
programmers in their understanding of your code. A remark begins (without
the quotes) with a '/*' and must end with a '*/'

#include <stdio.h> /* This header file defines printf() */

The next portion of a C program is the preprocessor directives. These
are #include and #define. The preprocessor directives are for the
benefit
of the C compiler. The #include <stdio.h> tells the compiler that you
will be
```

using the stdio.h header file. This header file contains information about the printf() function. Confusing? Don't worry I'm just trying to give you an outline of a C program, we will cover header files again.

4247. Repost, C Tutorial Lesson 2, 2 of 2

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-01 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19970101221000.RAA22737@ladder01.news.aol.com>
Source record: 7988

```
main() {

Remember, C is a structured language. That means you reuse code. over
and over.
Unlike languages such as BASIC, there are very few keywords in C. C is a
language
made up almost entirely of functions. Every C program contains a main()
function,
and by tradition main() goes first. Our example only has one function,
but in real life
C programs have many.

int count;

Initializes a variable 'count' and tells the compiler that it will be an
integer.

for (count=1; count<11; count++)

A for loop, don't worry about this just yet.

printf("\ncount=%d", count);

printf() is not a keyword! printf() is a function that is being called.
We do not have to
rewrite this function because it has already been written. The printf()
is in the header
file stdio.h which we told the compiler to use at the beginning of the
program.

getchar(); /* waits for the enter key before exiting */

getchar() is another function that is part of the stdio.h file.

}

Clear as mud now? Don't worry, I just wanted to familiarize you with the
makeup of a C program.
To Summarize: Start with some comments so you can remember what the
program is all about later,
then you will do some preprocessor directives, such as telling the
compiler what header files you
will be calling up in your program (what prewritten routines you will be
borrowing), then you will write
the function main() which contains the logic of your program. Finally,
you write any functions that
main() calls, but are not included in any header files(not necessary in
this tiny example, but done in real life)
```

4248. Repost, C Tutorial Lesson 3, 1 of 4

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-01 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19970101221100.RAA22780@ladder01.news.aol.com>
Source record: 7989

LESSON 3 - printf()

First, a personal aside.

I am using America Online to connect to the internet and anything that I try to post longer than a page will cause a disconnect, so I am going to have to keep splitting up these lessons. Which means, inevitably someone will find themselves missing a part. In addition, some newsgroup servers are so pressed for space that some articles do not last very long. If you need a repost..let me know.

Also, I realize that the example C programs that I have use probably still look like a bunch of gibberish, but don't let that get you down. Like any language things will become more and more familiar to you in time, untill eventually you will wonder why you ever thought it was hard.

I thought long and hard about what the lesson plan should be today. Its a common fault of most tutorials to get bogged down with text formattting issues. Text formatting is great for understanding legacy applications, but not necessarily as important for programming a GUI (Graphical User Interface) environment like GEM.

Nevertheless, the GEM AES (Application Environment Services) will have to wait for more advanced lessons. So lets tackle printf() now, so we can begin programming today and so we can use it to display output as we continue learning the syntax of the C language.

As I mentioned in earlier lessons, printf() is not a C keyword, but a prewritten piece of code which is contained in virtually every C library. To be precise, it is contained in the header file stdio.h. (STanDard Input/Output) It is an output function.

(End part 1 of 4)

4249. Repost, C Tutorial Lesson 3, 2 of 4

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-01 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19970101221200.RAA22807@ladder01.news.aol.com>
Source record: 7990

```
--How do I recognize a function?

Good question. Every function from the main() function to the most
obscure is always the functions name followed by a set of parenthesees.
Sometimes there is information inside the parentheseees, such as:

printf("Print this");

the information in the parenthesees is passed to the function. In later
lessons, we will cover in greater detail how information is passed to and
from functions. For now, just remember when you use printf() you are
calling a function, and information you place between the parentheseees is
information you are passing to this function, which it will interpret and
use to display information on your screen.

In the above example we are passing one argument. This arguement is the
STRING CONSTANT "Print this"...we can pass more than one arguement to
printf(). Consider the following example:

printf("My name is: %s","Robert");

within a C program, this would display:

My name is Robert

Why? Because %s is a FORMAT SPECIFIER. This tells printf() where to put
a value and what kind of value to expect. %s tells it to look for a
string. In this example the string is "Robert"

Lets take a look at another format specifier.

printf("I make %d per week",250);

This would display

I make 250 per week.
\
```

4250. Repost, C Tutorial Lesson 3, 3 of 4

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-01 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19970101221300.RAA22843@ladder01.news.aol.com>
Source record: 7991

Why? because %d is a format specifier for a decimal integer value. It takes whatever is on the right of the comma and plugs it into the string on the left. Lets combine the previous two examples.

```
printf("My name is %s. I make %d per week.","Robert",250);
```

What would this display?

In the above examples using format specifiers doesn't make much sense. It would be easier just to type out a string constant such as "My name is Robert. I make 250 per week" But remember, these are just examples, format specifiers do come in handy. Lets take another look at that Count.C program from Lesson 2 and see if it makes any more sense now!

```
/* Count.C */
/* This program will
count to 10 and
display the output */

#include <stdio.h> /* Header file where printf() is located */

main() {

int count;

for (count=1; count<11; count++)

printf("\ncount=%d",count);
getchar();
}
```

If we examine the printf() function call here, we can now see that the value of count is substituted for '%d' We can also see a '\n' that is not printed when we run the program. That is because \n tells the printf() to start a new line. In typewriter speak, it technically does a carriage return and a line feed.

For extra credit. Delete the \n from the above program and recompile and re-run it.

> Looking forward to this tutorial myself, but buggered if I can get
>hold of a C compiler ???

FYI: There are also C compilers available free of charge.

- Sozobon C
- GNU C/C++

Both are not for beginners, (no IDE) and demand a lot of RAM and disk space.
At least 4 MB RAM and about 5..20 MB empty disk space.

Chatwin from Dirk Haun is a shareware development environment for nearly all
programming languages.

You can find the related files on several ftp servers:

sunsite.cnam.fr/pub/Atari/Programming/soz*.zoo Sozobon C V. 2.0
ftp.uni-kl.de/pub/atari/languages/gcc/* GNU C 2.6.3
(version 2.6.3 is old but more
stable than 2.7.x)

There was a HiSoft C interpreter on coverdisk of ST Format 71.

This one is good for doing the very first steps in C, no large configuration
files and so on, it fits on 2 disks.

Disadvantages: No executable output, IDE not very compatible for newer
ataris.

As you know, I tested your recently made games, they are good for atari
machines designed in 1983, not for the newer, designed in 1988...

Can you use up to 16.7 mill colors in your STOS games? No? But you can do it
with GEM games...

Ohh! I'm very interested in that nice piece of software that can turn a
TT to 8 MHz, because it's impossible to do that without soldering and
redesigning 3 chips! (Reference: Atari TT 030 Hardware Reference Manual,
Atari Corporation, June 1990)

FYI: There are 3 official TT TOS versions: 3.01, 3.05, 3.06.
And some (>4) patched versions...

That sounds that you can't fix the STOS compiler to produce working code
for newer TOS versions. (I know from earlier postings that you own
MagiC for your ST and Gemulator and a MagiC PC demo.)

In <32c70945.13509507@news.airtime.co.uk> Tony Greenwood wrote:

[...]

That sounds that you can fix the STOS compiler to produce working code
for newer TOS versions.

Now here's the question: Can you or can't you fix it?

Are there 2 Tonys?
The first is saying "Yes, yes, it can be done!"
The second: "No, I've never said that!"

A much more important point: _WHY_ must you patch the STOS compiler?
Is this a very good build-in feature of the so called best game programming
language?!? This feature is so unique, I've never seen it in other actual
programming languages of the old year 1996. ;)

At this point: A happy new year to all.

I thought that company went out of business more than five years ago.

Sozobon C (various versions) is freely available on the Internet and can be
used on a 1 Mbyte machine with floppies IIRC.
The very best Atari compiler (not counting compile speed or IDE), GCC, is
also free, but you need 4 Mbyte and a harddrive to use that. G++ is the C++
version of the same compiler (only C++ available for the Atari).

Well, C++ was based on C. I think the ANSI-C standard did indeed take a few
features from the newer language, though.

>understand C++. Some people learning C++ learn C at the same time,

Unless you do very strange things, chances are good that your C program is
also a C++ program without you even knowing it. ;-)

You can well do without the things in C that are different in C++.
(I just tried to remember a difference, but I couldn't...)

>however it is wise to learn C first, and thoroughly before moving on to

Many people would disagree with that. I'm one of them.

You can easily use C++ as a 'better C' and not bother with the object
oriented things. The compiler will protect you from more stupid errors and
you can take advantage of many nice features.

Learning object oriented programming from the start is probably also a very
good idea.

>--Should I learn C or BASIC first?
>
>The fundamentals of programming, i.e. accepting input, manipulating data,

I guess this isn't the place to go into imperative vs logic vs functional
(vs whatever) programming. ;-)

>will find useful in other environments. There are versions of BASIC
>available free for the Atari computer, whereas C usually costs money. It

Hmm, apart from one or two BASIC versions that were released on magazine
disks, I've not heard of a free one.
On the other hand, there are several free C compilers.

>may be wise to start programming in BASIC to see how well you like
>programming, although C compilers are pretty inexpensive nowadays. C has

I'd rather say the main reason for using a traditional (interpreted) BASIC
is that you can more easily test (not too complex) things out. It's very
easy to crash the computer using C and you always have to wait for recompiles.

That sounds reasonable.

Your main() function is probably no more than 50 bytes or so, but the
printf() library function can be quite large. Your executable also includes
a bunch of stuff used by the initialization code that's run before the call
to main().

>Using GST C...Anyone have any opinions on this C ???? please?

I wonder how many even remembers it. ;-)

The code quality of such an early compiler is not likely to be very good
and it probably doesn't handle function prototypes or other ANSI-C stuff.
It's quite possible that it will be OK for this course, though.

Will the course be using ANSI-C, by the way?
If not, I hope there will at least be function prototypes.
(Does Laser C have that?)

I dunno if it's the call itself or just my compiler binding but I've
found most of the rsrc_gaddr() options do not work correctly. Thus,
all I tend to use is R_TREE and some macros. If you do it the same way
then ...

```
#define TePtext(ob,x) ((TEDINFO*)ob[x].ob_spec)->te_ptext

OBJECT *ob;
char *p;

rsrc_gaddr(R_TREE,tree_idx,&ob);
p = TePtext(ob,obi);
```

>Thanks for the C code for this but unfortunately (as I stated in the
>original posting) I'm using assembler and I do not know enough C to
>work out what is happening in the above.

Once you've got the tree address , index into the OBJECT array ...

p = tree + (itemnum * sizeof(OBJECT));
^^^^^^^^^^^^^
24 bytes iirc

Now add the ob_spec offset ...
```

```
p = p + 12

and fetch the TEDINFO structure address ...

p = *p /* ie something like move.l (a0),a0 */

Now you can access any of the TEDINFO members by adding the desired
offset. The te_ptext offset is zero so a move.l (a0),d0 will leave you
with the address of its nul terminated string in d0.

As my assember knowledge is pretty vague here's another example in
case I've screwed up the above ...

Fetch TEDINFO address for object item 5 say, p = ob[5].ob_spec ...

p = ob + (5 * 24) + 12
move.l (p),te_ptext

> I'm finding out the address of the te_ptext by using rsrc_gaddr()
>
> Is the address returned by doing this the actual address of the text
> or does the returned address just hold the address of the text?

It depends. With rsrc_gaddr you find the address of a specified structure, but you need it's index in the corresponding array. For TEDINFO you'll rarely have it. I normally use the following sequence of lines to get the address of the te_ptext :

```
OBJECT *tree;
TEDINFO *ted;
char *ptext_ptr;

rsrc_gaddr (R_TREE, MY_TREE, & tree);
ted = tree[MY_TED].ob_spec.tedinfo; /* this is Pure C */
/* ted = (TEDINFO *) tree[MY_TED].ob_spec; should almost always work */
ptext_ptr = ted->te_ptext;
```

The first line gives you the address of the root object of the object tree, the name of which is assumed here MY_TREE, and which is specified inside your resource construction set. From that address, using the index of your TEDINFO object MY_TED, again set in the resource construction set, the address of the TEDINFO structure is gained. Note that this notation depends on how your compiler defines the OBJECT structure. You may need to use the notation commented out. Using the address of the TEDINFO you immediately have the te_ptext, as well as any other component of the TEDINFO, like te_pvalid, te_ptmplt, etc.

> What is the size of a Form CPX dialog? For example: 304 by 152 pixels.

The root object of any CPX must be 256 x 176 pixels. I believe the COPS (an Xcontrol replacement) does not require a CPX to be this size. But I highly recommend to not differ from this size, so that other people without COPS can use it too.

Sounds right. The reason is that printf() is a super duper function that is able to do virtually everything in terms of text output. It thus takes some space. There are smaller, more specialized functions, I'm sure they will be covered in later lessons.

> Using GST C...Anyone have any opinions on this C ???? please?

It's a rather old, not all too efficient c-compiler. But this holds for the lessons reference compiler Laser C too. It should certainly do everything required for this series of lessons. But it also means that you should not despair if you can't get a sample program to work, you might have come across a compiler bug. This happened to me, I learned programming C using Megamax C and a few times I was close to despair. But with growing experience you learn how to destinguish compiler bugs from your own ones.

Cheers Peter

From: lecoat@tokay.ief-paris-sud.fr
Message-ID: <5ag53h$rml@upsn6.u-psud.fr>
Source record: 7912
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.programmer

Hello everybody,

I'm a french developper working on a program called Eureka 2.12.
It's a 2D numerical analysis program, and a 3D modelling of
mathematical shapes. It also includes 4D presentation, because
a time parameter is available. It's quite easy to make movies
showing the evolution of a formula in 3D rotating, morphing from
a shape to another etc... Data files can be loaded so that you can
manipulate series, or even stereo/mono sample files manipulating
sounds. Images can be produced, computing them with formulas to
draw fractals such as Julia or Madelbrot sets. You can even map
these images on a 3D surface, producing impressive representations.
Since recent revision of my program it is now in two languages
French and English. The english translation of the documentation
will be soon available. My goal is to make a program like some
on other platform such as Mathematica or Matlab. It has been
tested with success on MAGIC, TOS2WIN and STonX.
My work is a complete package including the program and some
accessory like a snapshot, an unusual recording accessory that
allow you to demonstrate the program like a mecanical piano would
play Stravinsky (?). There's a program that can show your movies
etc ...
The latest english version is available on my home page at :
http://www.ief.u-psud.fr/~lecoat/
That page is mainly illustrated with my program so that you can
see what is possible to do. Eureka has 3D2 Raw and VRML exports
so you will see Virtual reality demonstrations of objects, and
movies or images produced with Persistence Of Vision.
The latest revision will also be available soon by FTP on the
"Conservatoire National des Arts et Metiers" at :
ftp://ftp.cnam.fr/pub/Atari/Applications
Anyway for any problem report in my mailbox at :
lecoat@ief.u-psud.fr
Any suggestions are also welcomed ...
Have fun with my production, bye for now ...

Almost anything you do, however small, will cause library(s) to be linked
into the program. There is a "zero-code" overhead!

Relax! The library(s) are only linked once - you can go on to write megabytes
of your own code with no further overhead.

Are you sure that STiK won't install a cookie jar if there is none ?
I'd have guessed STiK and AtarIRC would run without any extra additions.
Just HSMODEM is recommended, but not mandatory.

Cheers Peter

Nope.....you are spending far too much time looking through back
posts, your are soooo confused,

I own the Gemulator DEMO
I do not own and have never owned the MagiC PC demo
I have MagiC but not for my ATARI (MagiC on floppy system????)
I tried MagiC on the Gemulator Demo
I now use Gemulator DEMO and tos image

From postings in c.s.a.st it would seem the Gemulator demo and full
product act considerably different, for example the full version wont
accept a tos image?

If you are going to constantly quote old posting then do try and take
notes of some sort.....

>> YES!....Give us a new TOS version and it will be fixed for it just
>>like all the rest have ?
>[...]

>That sounds that you can fix the STOS compiler to produce working code
>for newer TOS versions.

Not by me, I can only program in BASIC, I do not make the fixers, but
simply quote what the fixers authors claim?

>Now here's the question: Can you or can't you fix it?

I cannot, the authors of the fixers say that if a user of any tos
version will spend 5 minutes helping them then they can fix for any
tos, including madusa and hades....chew on that!!!!!

>Are there 2 Tonys?

Childish of you....

The first is actualy saying as far as he knows it can be done,

>The second: "No, I've never said that!"

bollox, you made that up?

>A much more important point: _WHY_ must you patch the STOS compiler?

ho no....yawn yawn yawn......why must you ask, do we realy need to go
through all this...yawn yawn yawn

>Is this a very good build-in feature of the so called best game programming
>language?!? This feature is so unique, I've never seen it in other actual

WAIT...you are wrong again, who called it the best games programming
language? I certainly never called STOS the best games programming
language,
Ho dear...so confused that you came to the wrong thread?

>At this point: A happy new year to all.

and a Happy new year from me,

BTW for the confused amongst us, and especialy people like Uwe who
does not even understand the thread he is trying to contribute
to..although contribute is a loose term when he writes so much
untruths?

The thread was..STOS is the best BASIC for making games in 1996, then
I added that I would include C and say that STOS would even beat that,

2 POINTS FOR EVERYONE TO NOTE

1) I have since seen a demo of HEARTLAND by Hans and it looks like it
will eventually be better

2) It is now 1997....the thread is mute....

Look!....in the above that YOU quote, it quite clearly states that my
original comments where my belief, but after seeing what Hans has to
say I have since changed that beleif, that is what the above says, if
you do not understand then you should not make such statements, I
conceded that given the information Hans has provided that I would
then be wrong, so just what exactly are you going on about ????

>>attitude, they think STOS=CRAP, they ignore wihout even testing
>>software simply because they know it is STOS,

>Most of them will still ignore STOS.

yes my point exactly, because they have a pre conceived idea of what
STOS can produce, I am trying to change those views, I beleive I have
managed this to a certain extent with many people,
A lot of people now do not automaticaly label STOS as "slow",
"unresponsive", "jerky" and "only good for small crap games", those
statements can NOT now be levelled at STOS,

>
>Please have a look at this posting in maus.sys.atari.software:

I looked at my copy of the Compendium (April 1994 edition), and it doesn't
appear to mention (in Chapter 10 [dedicated to XCONTROL]) pixel size of
the root object - only about the callbacks XCONTROL makes (cpx_init,
cpx_call etc) and the utility funcs XCONTROL makes available to a CPX.

> (AOL won't let me post long articles)...

I think it's wise to put at least one week between the lessons. That gives us time to respond on the lessons and discuss problems found. It also gives the lossons time to reach all of the readers. Bigger messages sometimes need serveral days to reach everybody. No one will get bored, I think but byt going to fast you will loose those who can't spend every evening behind the computer.

I sometimes see repleys to questions that arrive two or three days later. At this moment the lessons get lost in posts, reposts and forwards and that's a pity. The lessons are a great initiative, don't spoil it by rushing it.

It does a nice job for making games, but its core is still rotten. It works just fine on a 8 MHz ST, accelerated ST and the Falcon are a may be, all else simply won't work. This realy can't get the qualification good from me. Let us stick to ST arcade games:
Assembley is best
C is good
STOS comes right here
Put here all other basics

>> So, the answer is no. The TT and the STe are about the same age. It
>> took STOS support over five years to fix it for a TT. Did you cover

> that no TT owner came forward with the information needed to fix for
> there machines ?

It JUST needs upgrading to TOS versions? I am sorry, but I think this is not a small disadvantage of a programming language. For most programmers it's unacceptable. They will call any language needing this kind of fixing utter crap.

>> There are at least 2! Are there important differences between the
>> German,
> French
>> and UK versions of the TT TOS? Who can tell?
>
> Yes who?....so you cannot argue for or against can you ?

It simply means you can never tell STOS will work on a certain machine because you can not no if the TOS version used in that machine is known by STOS. You can never say: STOS will work on an ST compatible computer. It always has to be something like:
This game will work on TOS 1.0 (UK) 1.02 (UK and German), 1.04, 1.06, 2.06....

A game written in most other languages only need ST, Ste, Falcon or TT hardware to work. TOS version is not important.

>> Forget the point about 8 MHz. (You can't set a Falcon to 8 mhz (to say
>> in words 8 milli Hertz).) If your game is supposed to work in 1 vbl
>> then simply wait
>
> You can't?....ho I didn't know that?...mute point then ?

You can switch a Falcon to 8 MHz, not 8 mHz. There is a factor 10^9 between
those ratings.

> and how many C coders could have made that version of heartland you
> did?, not many, if they could, then how come no one does?, they cant
> all be making poxy gem applications that have already been made ten
> time over?

I really don't know. I expect all members of the TOS-crew could have done the
same thing. Of the TOS crew 3 out of five members switched to other systems. One
of them has written a MUD in C.

In general I think most of the C coders are doing more interesting things then
writing games, just like I have been doing for the past years. Secondly a good
game concept and graphics are as important as a good programming language to
write the game in. That's why STOS still exists. It allows people with good game
ideas or good game graphics and not enhough programmings skill to write a game
themselves to write a game never the less.

A C simply makes an other type of program when there is no one to inspire him
with good ideas and graphics. There are lots of good assembley coders out there
too, but it needs more than a good coder to write a game.

>> I think that you have to experience advantages like that to appreciate
>> them, they are not highly necesarry, but make the live of the

Yes, the same idea, a bit clumsy though, but it works.

> BTW I now have GST C and am taking the C tutorial in c.s.a.p, this is
> after learning a little about C from this thread, and after seeing
> your heartland demo, that swung the decision to learn C,

Be warned, you need more then some knowledge about C to do a game like I did.
You also have to know how the graphics system of the Atari works.

I now a bit of the answer: STOS is using fixed ROM adresses to do some things. I don't know why it needs those adresses but every STOS program hase a table of ROM adresses that's used to get some fital information. So STOS has a build in incompatibility to every not yet released or unknown TOS version. I think the author of the gerneral STOS fixer can explain us which adresses are exactly needed and why.

> one floppy disk only, then this is not only annoying but also time
> consuming:(

One of the advantages of C is that you can do almost anything in it, but it's also one of its disadvantages. You can do very stupid things and the compiler won't warn you that what you are doing is stupid. It just compiles it and the program will tell you you were stupid by crashing in a horrible way. :-) ? :-(

A good example is writing over array boudaries. Most pascal programs will stop with an error telling you tried to acces an array alement that doesn't exist. C will let you do it, allowing you to alter data that isn't part of the array you think you are accessing. Normally this causes the program to crash on very strange points or do very strange things. This is an well known hard to find bug in a C program. The most common error of this type is the off by one error: you are accessing one element too much.

But don't ley me spoil all those nice things to be discovered for you. You will meet this kind of problems soon enhough. ;-)

hehehe you just cant say it wihout adding something can you :)

>just fine on a 8 MHz ST, accelerated ST and the Falcon are a may be, all else
>simply won't work. This realy can't get the qualification good from me. Let us

what else is there?...ho yeagh, madusa and hades..hmmmm

>stick to ST arcade games:
>Assembley is best
>C is good
>STOS comes right here
>Put here all other basics

Well after seeing what YOU accomplished with C then I would now agree
with the above, this of course means Uwe will instantly quote me
saying I said different last week :(
But the above now looks about right to me,

However :)....a couple of months ago and you would have put STOS at
the bottom of the list, yes? ?

> > that no TT owner came forward with the information needed to fix for
> > there machines ?
>
>It JUST needs upgrading to TOS versions? I am sorry, but I think this is not a
>small disadvantage of a programming language. For most programmers it's

It is absoloutly no dissadvantage to me, and I am programming ?, the
compiler fixes the programs when compiling, so I wouldn't even notice
now?

> > Yes who?....so you cannot argue for or against can you ?

>It simply means you can never tell STOS will work on a certain machine because

But surely thats true of any language, you can never be sure, lok at
magiC, Not doing very well even on a Falcon....it's not just STOS that
this kind of comment can be aimed at..

>never say: STOS will work on an ST compatible computer. It always has to be
>something like:
>This game will work on TOS 1.0 (UK) 1.02 (UK and German), 1.04, 1.06, 2.06....

I see that as reasonable, a far better solution than saying it works
on everything...then it doesn't ?

>A game written in most other languages only need ST, Ste, Falcon or TT hardware
>to work. TOS version is not important.

True, in MOST other languages, not all ?

> >> in words 8 milli Hertz).) If your game is supposed to work in 1 vbl
> >> then simply wait

> > You can't?....ho I didn't know that?...mute point then ?

>You can switch a Falcon to 8 MHz, not 8 mHz. There is a factor 10^9 between
>those ratings.

So what was the point of the above?, trying to confuse me?

> > and how many C coders could have made that version of heartland you
> > did?, not many, if they could, then how come no one does?, they cant
> > all be making poxy gem applications that have already been made ten

>I really don't know. I expect all members of the TOS-crew could have done the
>same thing. Of the TOS crew 3 out of five members switched to other systems. One
>of them has written a MUD in C.

So your average C user could not have made your version of
heartland?, that tells us a lot doesn't it?, we are then back to given
the choice, then STOS would be the language to choose, I have a
feeling a program like that would scare the hell out of MOST c
programers:)

>In general I think most of the C coders are doing more interesting things then
>writing games, just like I have been doing for the past years. Secondly a good

that is a very biased opinion, more interesting?, who defines what is
interesting?, you may think making an archiver that will never become
standard is interesting, I say making a game that people enjoy is more
interesting?, seeing graphics come to life is far more interesting
than getting something to pack down one more byte :)

>write the game in. That's why STOS still exists. It allows people with good game
>ideas or good game graphics and not enhough programmings skill to write a game
>themselves to write a game never the less.

Ho back to insults now, so I do not have enough programming skills to
write a game....tsk:(
the above is stupid, anyone playing a good game written in stos will
not think the programmer has no skill, good grief man! what the hell
are you talking about ?

>A C simply makes an other type of program when there is no one to inspire him
>with good ideas and graphics. There are lots of good assembley coders out there
>too, but it needs more than a good coder to write a game.

Really? a minute ago all you needed was STOS and an idea?

> >> I think that you have to experience advantages like that to appreciate

> > But I have a couple of disks full of much used routines that I can

>Yes, the same idea, a bit clumsy though, but it works.

I take it that was you way of saying I am right.....hehehe

> > BTW I now have GST C and am taking the C tutorial in c.s.a.p, this is

Thanks to everyone who has helped me on this. I have now managed to
read the text from the te_ptext.

One point however.

Someone mentioned that putting '@' at the start of the field resets
the cursor to the start of the field.

I have found that this works fine under normal TOS but under Magic (on
my falcon and Magic PC for that matter) it doesn't seem to work.
The solution to this appears to be to put a null at the start of the
field instead of @. Is there any reason why I shouldn't do this?

Yes, but this is only because Pure C treats the floating point stuff
separatly. You very likely linked a printf() version that is not capable
of %f, %g and others. In case of Pure C you need to use the PCFLTLIB for
floating point support, and then even this grows bigger. This behaviour
is not all to common, most compiler's libraries only have one version of
printf(). On top of all this : Yes, the GST linker is probably not very
smart, but this makes not much difference here.

Cheers Peter

No, the Pure Debugger works brilliantly under MagiC's preemptive
multitasking.

Doesn't cause harm. However one of the many bugs with normal TOS leads to
the situation that an edit field filled with underscores is shown, which
is the same as an empty field but the cursor is at the end.

I use MagiC too, and I'm pretty sure I used the trick and it worked under
MagiC ...

How 'bout a new newsgroup "comp.sys.atari.knitting" then? :)

But seriously, there is a sort of knitting program for the TT called "Stitchitiser" (sp?). It is used to design emblems/logos for clothing and then "prints" them to a machine which sews them onto fabric. The package lets you use multiple colours, stitch widths, etc.

When the package was demonstrated to the local user group here a few years back, we were told it was $30000 (Australian) for the software, TT and the other hardware (which I would say is the bulk of the cost).

Just thought it would be interesting for all the knitters out there :)

Dave,

> Can anyone help me with this or point me to somewhere that I can get
> more info on the structure of TEDINFO? (on line preferable as I can't
> really afford to buy any books on the subject)

Ok the start of the TEDINFO structure is pointed to by the OBJECT.ob_spec field of the object structure, the text of the actual object (the edited) text is pointed to by the TEDINFO.te_ptext field.

Below is a macro I wrote many moons ago to calculate the start address of the TEDINFO structure of an object. Field \1 contains the address the resource tree and field \2 contains the address of the object. a5 will then contain the address of the TEDINFO structure.

Because TEDINFO.te_ptext field is at the top of the structure to read the text all you have to do is - move.l (a5),a5 - and then copy from the address stored in a5. Example shown below.

To find other information fron the TEDINFO structure reference the the table shown below.

```
;----
;tedinfo_str macro
;Calculates address of tedinfo structure!
;----
tedinfo_str macro
move.l \1,a5
add.l #(\2*24)+12,a5
move.l (a5),a5
endm

get_text:
tedinfo_str dial_addr,obj

move.l (a5),a5
lea string,a4

loop
tst.b (a5) * tst for null
beq .done
move.b (a5)+,(a4)+
bra .loop
done
move.b #0,(a4) * add null

; a similar method maybe used to write text to the dialogue field.
```

```
TEDINFO:
te_ptext: ds.l 1 ; Pointer to text
te_ptmplt: ds.l 1 ; Pointer to template
te_pvalid: ds.l 1 ; Pointer to string containing valid chars.
te_font: ds.w 1 ; Font used, 3=sys font, 5=small font.
te_junk1: ds.w 1 ; reserved
te_just: ds.w 1 ; text justification, 0=left,1=right,2=centre
te_color: ds.w 1 ; object colour and pattern
te_junk2: ds.w 1 ; reserved
te_thick: ds.w 1 ; border thickness
te_txtlen: ds.w 1 ; length of te_ptext (inc. NULL)
te_tmplen: ds.w 1 ; length of te_ptmplt (inc. NULL)
```

Hope you find this information useful.

Possibly GST is linking in the floating point printf() stuff as well?

>debug info.

MWC omits the floating point parts by default, saving quite a bit of
space. Can PureC do something similar?

Daan,

DS> I am looking for a DOS utility to convert GFA BASIC source files to
DS> an ASCII text-file. Can anyone help me?

I assume you are talking about converting a tokenized GFA BASIC program into an ASCII text listing of the program? (A GFA BASIC .LST file is already standard ASCII text)

As far as I know, the only way to do this is with a copy of GFA BASIC. Just load the GFA BASIC program, and then Save As ASCII (may be called WRITE? I can't remember what its called right now).

Message-ID: <3a8_9701032040@conchbbs.com>
Source record: 7939

s > ho?....so the whole library is used when you only need part of
s > it?,

That depends on the linker.

The main problem is that printf() can format strings, chars, ints, longs, and floats, and calls a bunch of other functions to handle all of these cases. It also uses stream I/O, which requires a considerable number of functions to handle its buffering and error handling peculiarities. It also needs to parse the format string.

You could save considerable amounts of RAM calling functions like Cconws(), strcat() and ltoa() and doing all of the formatting yourself, but that is hardly to goal of a tutorial.

Yep, as soon as you link the floating point library the floating point printf is linked too. But I am not very familiar with this part of Pure C, I almost never use it.

> that this kind of comment can be aimed at..

Dear Tony, Magic is exactly the kind of program that has to eat all the shit the hardware brings, that is because it is an operating system. All programs running under the OS don't have to worry about the particular hardware because the OS does.

STOS is an programming language, just as C, Pascal, Modula 2 and the other basics. A programming language can use the OS to acomplish certain tasks. The programmer can decide not to use the OS and go directly to the hardware for the sake of speed, knowing he has to pay the price of incompatibility.

The problem with STOS is that the programming language itself doesn't use the OS the right way, forcing you ino a lot of problems. It's like a paint program expecting the screen memory to start at $78000 (that's rthe start of screen memory in a half Mb Atari ST), needing fixing for all other memory configurations. (There was actually a game that had this problem, it was Hacker.)

>> never say: STOS will work on an ST compatible computer. It always has
>> to be something like:
>> This game will work on TOS 1.0 (UK) 1.02 (UK and German), 1.04, 1.06,
>> 2.06....
>
> I see that as reasonable, a far better solution than saying it works
> on everything...then it doesn't ?

I can say that my compression program works on all Atari compatible computers. And if there are trouble it is my own mistake, I did something wrong then, not the programming language I use.

The samething can be said about Heartland 2.0, it will work on all Atari compatible computers with ST compatible videohardware, a soundchip and a MFP. Because I know I am directly accessing that hardware and I am depending on some properties of that hardware.

>> A game written in most other languages only need ST, Ste, Falcon or TT
>> hardware to work. TOS version is not important.
>
> True, in MOST other languages, not all ?

I can't think of an other example like STOS, but I am not 100% sure there is none. Maybe there still are some obscure languages that won't work on a 68020 and higher because the stackframes are different and some instructions became privilidged. But depending on the TOS version like STOS does is (AFAIK) unique.

>> You can switch a Falcon to 8 MHz, not 8 mHz. There is a factor 10^9
>> between those ratings.
>
> So what was the point of the above?, trying to confuse me?

Ok, let me unconfuse you.
1 ST, Mega ST and STe work on 8MHz.
2 There are accelerated ST's, switching back to 8MHz might be possible but the way to do that is accelerator card specific.
3 A Mega STe works on 16MHz, it can be switched bac to 8 MHz

4 A TT works on 32 MHz (there are a few pre production TT's working on 16 MHz), clockspeed can be switched back to 8 MHz
5 A Falcon works on 16MHz, it can be switched back to 8MHz
6 There are accelerated Falcons. I don't know what happens when you try to witch back to 8MHz on these Falcons.
7 Clones and emulated Atari's work on a variety of clockspeeds, no change of switching back.

Bottom line is: Don't rely on the hardware to be 8MHz for correct timing of your programs. Make sure your timing is independend of the clockspeed, how that can be done was shown in my previous mail. Feel free to ask if you have questions about the code, that's what a newsgroup like this is for, isn't it?

>> and how many C coders could have made that version of heartland you
>> did?, not many, if they could, then how come no one does?, they cant
>> all be making poxy gem applications that have already been made ten
>> time over?
>
> So your average C user could not have made your version of
> heartland?, that tells us a lot doesn't it?,

I realy can't tell, honest, not the slightest idea. I don't know what an average C user knows about the language he is using, I don't know how much he knows about the OS and don't know howmuch he knows about the hardware. I don't even know how much knowledge is needed to do something like that. I only do know one can write better games in C then in STOS.

For me it was quite easy. Most of the time was spend hacking your game to get the graphics and to convert them into the format I could use for my game.

> we are then back to
> given the choice, then STOS would be the language to choose, I have a
> feeling a program like that would scare the hell out of MOST c
> programers:)

The whole idea of coding a game would scare a lot of people. For a C programmer, knowing he has to use basic will be enhough to commit suicide. A C programmer won't go back to basic, unless he really has to, because there is no C available.

>> In general I think most of the C coders are doing more interesting
>> things then writing games, just like I have been doing for the past
>> years. Secondly a good
>
> that is a very biased opinion, more interesting?, who defines what is
> interesting?

Why are people programming?
1 Because is't their job.
2 Because they like it.
We can forget the first group of people, unless they belong also to the second group as well.

The people of group 2 will program because they like it. It doesn't matter what they program or why they do it. So the people who program for fun are the people who define what's interesting. You said you haven't seen many C games lately, let me give you some hypothesis explaining it:
1 you didn't look good enough.
2 there are far less C coders as STOS coders
3 most C coders are doing more intresting things then coding games

I am only quite sure that point isn't true.

> you may think making an archiver that will never become
> standard is interesting, I say making a game that people enjoy is
> more interesting?

Yes, you may say so. (BTW: my compression program is the only compression program still being supported on the Atari ST platform and the lastest version does create LZH archives.)

> seeing graphics come to life is far more
> interesting than getting something to pack down one more byte :)

Not for me, the best days for me are when a new routine is working as it should, packing a few bytes better, or a few seconds faster. Writing the game engine was also nice, but designing new graphics and a new game map is not my idea of having fun.

>> write the game in. That's why STOS still exists. It allows people with
>> good
> game
>> ideas or good game graphics and not enhough programmings skill to
>> write a game themselves to write a game never the less.
>
> Ho back to insults now, so I do not have enough programming skills to
> write a game....tsk:(

Nope, you proved you could do it with STOS. But could you have done it whithout STOS? It is easy to get started in programming with STOS. That's what a basic is all about. To program a game in C requiers more programming skill, but the result can be better too!

> the above is stupid, anyone playing a good game written in stos will
> not think the programmer has no skill, good grief man! what the hell
> are you talking about ?

And all STOS programmers admire the programming skills of the writers of the language extensions, because they can't do things like that themselves? The players of those games don't bother about how much prohramming skill was needed to create the game. But as an programmer I can say you need probably less programmings skills to write a game in STOS then in C. STOS is easier, but at the same time I can say C can make the better games and is therefore the better language for writing games.

>> A C simply makes an other type of program when there is no one to
>> inspire him with good ideas and graphics. There are lots of good

>> assembley coders out there too, but it needs more than a good coder to
>> write a game.
>
> Really? a minute ago all you needed was STOS and an idea?

No, you are mixing up my words. With an idea you can write the game in STOS. If you read the above you will see the assembly coders have the programming language, but they are missing nice ideas or graphics.

> ho and of course STOS programmers don't know anything about the ATARI
> graphics system do they, hmmmm making cups of tea and the odd game,
> nothing too taxing for us STOS users hey?....tsk tsk tsk

Well, you showed me you knew nothing about the graphics hardware of the ST! With knowing about the graphics system of the ST I mean knowing about the hardware registers on adres $ff8200 and up. When I was happily poking around in those hardware registers in an example program you told me you didn't understand, and that you were using STOS so there was no need to understand it.

Bye, Hans Wessels

> That sounds that you can't fix the STOS compiler to produce working code
> for newer TOS versions. (I know from earlier postings that you own
> MagiC for your ST and Gemulator and a MagiC PC demo.)

Right... as of 45mins ago it can probably be fixed for all true Atari
versions of TOS. I will add Magic code soon, hopefully...

Now, discounting this new (currently unreleased) version of the
interpreter/compiler, I shall explain...

The reason STOS doesn't work with Magic is simply because magic needs
a different set of values in the table of addresses. Obvious. Now,
STOS doesn't know about magic (written before it was released), and
so only checks the TOS version - not the AES version. Thus, a Magic
based machine appears to be the TOS version of the original TOS.
(definately true for Magic 2 - it returned 1.62 on an STE when tested.)
This makes it impossible to have values for both Magic and TOS in
the same table - the same OS version.

Now, the reason that STOS doesn't work with TOS images is due to the
VERY wierd way that STOS found the OS version. This is now fixed in
my latest compiler mods, so hopefully this problem is resolved. (yet
to be tested). There may also be problems with the contents of the
tables - I'm looking into these...

> Now here's the question: Can you or can't you fix it?

Yes. Not necessarily in a way that it will work with all OS's at once
(without my new code), and definately not with image files...

> A much more important point: _WHY_ must you patch the STOS compiler?

Good question... someone thought that it would be a good idea to have
a table which had offsets (?) to certain frequently used routines
and addresses so that they could easily be found by each different
module. (STOS is written in a VERY modular way... Dynamic linking,
effectively... not bad fo 1987)

It's been a long time since I've done any ST programming, but from what
I remember of the cookie jar protocol, a program that utilizes the
cookie jar but does not find one on the system should CREATE the cookie
jar and install it.

Assuming the the programs you wish to run don't do that, I think there
is a cookie jar CPX that will do this. Otherwise, find a TSR that will
install the cookie jar for you and run it first.

Mask in the SMALLER attribute to wind_create().

When you click on it you'll get this message ...

msg[0] = WM_ICONIFY
msg[3] = window handle
msg[4,7] = area of iconified window (ie do a wind_set())

and the reverse is ...

msg[0] = WM_UNICONIFY
msg[3] = handle
msg[4,7] = original area (wind_set() again).

A CTRL click will send you WM_ALLICONIFY if you want to bother
implementing it.

Sorry, I haven't got the actual values to hand. :-(

I'm not sure what strtok(NULL,"|") is supposed to do (other than
cause a two bomb error). This usage is certainly not in my ANSI C
reference.

However, it works fine with Pure C, stopping at the right spot.

No, Toad is not the ONLY company. Computer Direct is pretty well
exclusively devoted to TOS and MagiC platforms. Toad is hyping their PCs
(with Gemulator built in) and their Internet service provider business.
They still sell Atari stuff, and provide support, but appear to be
winding down their involvement in the world of TOS computing. Computer
Direct, on the other hand, will only sell you a Mac or Mac Clone if you
REALLY insist, and steadfastly refuse to have anything whatsoever to do
with PCs. Check them out at http://compdirect.com. They are doing some
really amazing stuff.

Bill Merik
VERY satisfied Computer Direct customer and beta tester.

Source record: 7857

In my first writing of the introduction, I was under the impression that a certain unnamed BASIC was free, which in fact, it turns out is not free.

However, with most computers, C64, Atari 800 or MS-DOS, have a free version of BASIC included (Commodore BASIC, Atari BASIC or GW BASIC) what have you...If there are free versions of C for TOS, then PLEASE, seriously PLEASE tell me where to find them so I can test my programs on this compiler and tell all those people who do not have compilers where they can get one. That will solve some of the problems related to this tutorial.

As for your other comments, I'm not going to argue with them, the fact is there are some good points in your posting, and .... C and C++ are related languages, obviously, but the concept of programming object oriented code places an emphasis on different skills...in any event so few Atarians have a C++ compiler that the point is moot.

4314. Re: C tutorial begins January 1st

Newsgroup: comp.sys.atari.programmer

Yes, feel free to clarify,

Yes, Megamax is out of business. I am not current on all of the Atari issues, so please jump in when I stick a foot in my mouth.

I thought most compilers would come from a company that has since abandoned the Atari platform since Atari has abandoned the Atari platform...

If you find a company that has active support, I would choose it over Megamax anyday.

Thanks for your help.

4316. C Tutorial, Lesson4 page 1 of 4

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-05 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19970105024700.VAA08357@ladder01.news.aol.com>
Source record: 7860

Lesson 4 - Variables and printf();

OK, in lesson 3, you were introduced to the world of printf(). Today, we are going to learn about variables. We will then demonstrate the use of variables with printf().

Variables are a basic component of every computer program. Variables are used to set aside a portion of the computers memory. This portion of memory is then identified by an easy to remember name. This name is assigned when you define the variable. I'll give you an example. Let's say that I added the following line to a C program:

```
int lives;
```

What I've done is told the compiler that I will be using a variable, and that the name of this variable will be 'lives'. Also I've told the compiler that this variable will be an integer. (whole number)

In C you cannot use a variable unless you first define it. This is because the compiler needs to know exactly what type of data is going to be stored so it can make the most efficient and logical use of memory.

In the above example 'int' told the compiler to set aside space for an INTeger variable and that the variables name is lives. We are now ready to use the variable. We can assign a value to this variable. We could add the following line to our C program:

```
lives = 4;
```

With this bit of code we have assigned the integer value 4 to the variable lives. To save some time, most compilers allow you to combine the two example C statements into one, thus:

```
int lives = 4;
```

Another shorthand is to declare more than one variable of the same type at once:

```
int month, day, year;
```

That does it for this lesson. I'm sure you all still have some questions. For example: what happens if you mismatch format specifiers? The answer is C will do its best to interpret the variable in the format you requested. Try experimenting with the format specifiers in the above program to see what happens. Another question you probably have is: why are character values stored with whole digit numbers from -128 to 127. The answer is that the numbers correlate to letters using a lookup table. Try adding the following code to the above program:

```
printf("\n %c%c",72,73);
```

In the above line of code I didn't give printf() a character that the format specifier %c calls for. Instead I gave it a whole number. Printf() will not display the number, but instead display the character the corresponds to it!

OK, we've covered a lot of ground in this lesson and there are bound to be many questions generated. Please post to this newsgroup with your questions. I am going to pause for a week and give everyone time to digest the material.

NEXT LESSON: The next lesson will be posted January 11th and will cover operators.

4318. C Tutorial, Lesson 4, page 3 of 4

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-05 00:00:00 UTC
From: rdupuy5596@aol.com
Message-ID: <19970105083100.DAA17033@ladder01.news.aol.com>
Source record: 7862

```
Format Specifier | Use

%c | single character
%s | string
%d | signed decimal integer
%f | floating point in decimal notation

Got all that?

Lets put what we've learned together with a program.

Project: Write a program that uses variables to hold information about
the number pi and the number of sides of a triangle.
Answer:

/* Lesson4.C */
/* This program demonstrates the use of variables and format specifiers */

#include <stdio.h>

main() {

int sides;
float pi;

sides = 3 ;
pi = 3.14 ;

printf("\nThe value of pi is: %f",pi);
printf("\nA triangle has %d sides.",sides);

getchar();
}

When you run this program, pi is displayed as 3.140000! That is not
correct of course, but without anyfurther information printf() assumes
that a float value should be displayed to six digits of precision. We can
correct this problem by either defining pi to six digits or by providing
printf() some additional information which will tell it to display the
variable to only t digits of precision. Try the following
line of code:

printf("\nThe value of pi is: %.2f",pi);

The ".2" tells printf() to only display two digits after the decimal
point.
```

There are other variable types besides integer. The following chart shows some of the common types:

(*Chart deleted -see post named C Tutorial Chart- sorry about not including it here but America Online has disconnected the connection the last 10 times I tried to send this page*)

Got all that?

For now, I recommend using 'int' when you need to use whole numbers (used when you need to count something). Use float when you need a measured value. (example : float wage = 8.82;) And char for character values. (example: char grade = 'A';)

Question: Can't I just make things simple and use float all the time? Answer : No. Because of the way variables are stored in memory, this is not a good idea. Use 'int' for counting. Otherwise you will end up in the same predicament as government statisticians...that is with 2.4 children and owning 1.5 cars. It will become clear as you program more and more, why using the wrong variable type can have amusing consequences.

OK, you all understood lesson 3? In lesson 3, you were introduced to printf() and we covered two FORMAT SPECIFIERS. They were %s and %d. There are many format specifiers. There are specifiers for scientific notation, octal, and hexadecimal, among others. The following chart shows four common format specifiers. For the purpose of this tutorial I will only introduce new format specifiers as they become necessary.

Because of America Online, I cannot even send one full page before I get
disconnected. So here is the chart that, otherwise, would have been on
page 2 of C Tutorial Lesson 4:

Variable type | Keyword | Memory Useage | Use

integer | int | 2 bytes | Whole numbers
| -32,768 to
| +32,768

long integer | long | 4 bytes | Whole numbers
| -2,147,483,648 to
| +2,147,483,648

floating point | float | 4 bytes | Measured values
| +/- 10E38
| 6 digits of precision

double float | double | 8 bytes | Measured values
| +/- 10E308
|15 digits of precision

character | char | 1 byte | non numeric values
| -128 to 127

Find the next token in s.
>This usage is certainly not in my ANSI C
>reference.

Kernighan & Ritchie:

A sequence of calls of strtok(s,ct) splits s into tokens, each
delimited by a character from ct. The first call in a sequence has a
non-NULL s. It finds the first token in s consisting of characters not
in ct; it terminates that by overwriting the next character of s with
'\0' and returns a pointer to the token. Each subsequent call,
indicated by a NULL value of s, returns the next such token, searching
from just past the end of the previous one. strtok returns NULL when
no further token is found. The string ct may be different on each
call.

Errr... the culprit is not C, but a combination of C++ [more object oriented (and "buzzword compliant"), but slower than C] and Widows [like a snail pulling a locomotive through near-frozen treacle]. Oh, and the extreme register starvation and tedious instruction set of Itel processors.

Time to throw away your ANSI C reference, because it is certainly ANSI C.
strtok is a function to tokenize a string, that is the string is cut when a
separator is found. The second parameter is a string with separators. The first
time you call strtok the first parameter is the string that has to be tokenized,
the result is the first part of the string. All
subsequent calls of strtok() with as first parameter NULL will give the second,
third etc. part of the string.

Wow, an assembly die hard? I think it's easier to write the game in C and then optimeze all parts that take too much time in assembley. SO you can use C for memory management and disk io and getting raw speed for the graphics parts.

> getting at all the big companies that use C and such like instead of

Most of those big companies you talk about are writing games for intel x68 processors and there is absolutly no joy found in doing assembly for that type of processors.

A table with frequently used functions and adresses is no problem, as long as you fill in that table at run time. The weird part about STOS is that it the table has to be filled in at compile time and the program is trying to find out which table has to be used when the program is started. That's begging for problems. As you can create new tables for STOS you seem to know exactly which adresses are needed. Can't you patch STOS in such a way that the table is filled in at runtime? So when the program is started first your code is filling the tables with the right adresses and after that starting the rest of the program?

Ho, stop, now we are in compiler specific things. Time to grap the ANSI standard and correct a few things.

An int is guaranteed to be 16 bit, 32 bit many compilers, like Lattice C, use 32 bit ints.

> long integer | long | 4 bytes | Whole numbers
> | -2,147,483,648 to
> | +2,147,483,648

Same thing here, a long is at least 32 bit, bit it can also be bigger, like 64 bit on a Alpha processor.

> floating point | float | 4 bytes | Measured values
> | +/- 10E38
> | 6 digits of precision
>
> double float | double | 8 bytes | Measured values
> | +/- 10E308
> |15 digits of precision

Same thing here. In Pure C floats and doubles are the same thing. The minimum number of digits of a double is 10. The minimum value of a float or double is at least 10E-37, the maximum value is at least 10E37

> character | char | 1 byte | non numeric values
> | -128 to 127

Compiler specific, some compilers use unsigned chars by default, other use signed chars by default.

All quoted values come from my copy of K&R2, not from the real ANSI standard, but there aren't much differences between K&R2 and ANSI.

The exact minimum and maximum values of all these types can be found in limits.h.

> Anybody got some source for one?

Yep, I have one. It comes with a complete unix string library, that is all ANSI string functions plus some extra like strend(). The library is under GNU licence so no problems with copying it including the source. It comes with all functions in C, discription of those functions and a 68000 assembley optimized (by me) version of most of the functions. In the library is also an complete printf() function with al its diveratives and called functions (and it are less than 42 in this library, especially if you use the assembley optimized version, because most called functions like strlen are included in the source for the sake of speed).

The library is about 2Mb, but this includes all documentation. I can pack it down to a 340 kb file. I can mail it to you if you like.

>such when the time comes.

I need to correct you in that you may TRY to sell your Atari for any price you wish to ask for, but finding a sucker to pay it is another matter altogether. I can go to local electronic discount resellers(USED) and find 1040ST computers stacked in bins for $30 to $50 each depending on condition. If you purchased your computer thinking it would hold its value like a fine collectable, you are VERY mistaken. Computers lose their value almost as fast as the ice-cream cone you purchase from a street-side vendor on a HOT summer day. If I constantly thought about what I have paid for hardware and what its worth now. I would NEVER buy another computer again...

```
Crossfire
PC 80x86/68000 hybrid Macro Assembler

If you want a 68k assembler or pine for the 68k chip then read this

A friend has written an assembler called 'Crossfire' which supports
both 680xx and a modified form of 8086 (actually 80386). It needs a
386 minimum but I guess thats no problem these days.

With output both for 68k and 80x86 - its goal was two fold:-

1) To allow you to write 68k programs using a PC for running on a 68k
machine - (NOTE: It does not allow you to run them on a PC) The
pattern was DEVPAC which it now surpasses IMHO.

2) To write 68K alike programs on the PC. Using predominantly 68k
instructions and address modes, but 80x86 registers it is very
similar to writing 68k code especially PMODE code (which is the
preferred method)

; a nonsence example (and the .X's are not necessary - just habit)

move.l [esi],eax
lsl.l #1,eax
move.l eax,[edi]
add.l #4,edi ; no post increment (YET!)
swap ebx 'pseudo op'
clr.w bx 'pseudo op'
tst.w ax 'pseudo op'
beq.s .skip
not.l eax
.skip bsr fred
rts

That is not to say that a 80x86 programmer would be lost using
Crossfire.
It is not all things to all men - the dedicated 80x86 programmer would
perhaps not appreciate some of the features. If you have 68k'ed at
one time and perhaps pine for those times this could be for you, or
maybe not - the extra modes, instructions and methods are optional
- you can even mix styles, though as you can imagine this looks rather
messy.

NOTE: I will not dwell on the basic 68k mode - it's just that - more
than a match for most. Suffice that it has Nested Macros, INCLUDE,
```

INCBIN, local labels, string handling, opcode overides, repeat loops,
conditional assembly etc....

It is modified in the respect that it is geared for the 680xx
programmer wanting to write 80x86.

Some of the more important features are:

* allows operand reversal (for 68k alike):-

Conventional 8086 mov al,5
reversed 8086 mov 5,al

* allows 68k instructions

'MOVE' as well as 'MOV'
'Bcc' as well as 'Jcc'
+ many others

to give
you a little more.

CrossFire Assembler, By Mark Parry
80x86.DOC

This document explains the Intel 80x86 processors/instruction set from
the perspective of a Motorola 680x0 programmer. It is not a intended
as a complete guide to programming the 80x86 range of processors. You

should also look at the document "FILETYPE.DOC" to see how various
output file formats are supported, especially for types ".COM",
".EXE", ".SYS" and ".EXL".

Introduction

The reason for CrossFire? Originally, I wanted to write a 680x0 assembler on the PC, to take advantage of the much faster processor speed. I could of probably have coped with the annoying quirks of PC assemblers, but I could just not get my head around the opposite syntax of the instructions. For this reason, I had to write an 80x86 assembler that I could work with. CrossFire's version of 80x86 is as close to 680x0 as I could make it.

Example: store value (41 hex) in memory on different assemblers

MOV BYTE PTR [BX],41h TASM/MASM/etc.
MOV.B [BX],41h XFire 80x86 (normal syntax)
MOVE.B [BX],#$41 XFire 80x86 (normal syntax)

MOVE.B #$41,[BX] XFire 80x86 (reverse syntax)
MOVE.B #$41,(A0) XFire 680x0

Being used to programming the 68000, it was a major culture shock switching to the 80x86. The assemblers do not help, they seem to be lumbered with a lot of unnecessary and awkward features.

I don't like having to keep modifying segment registers. Earlier versions of the assembler had to, and it was a nightmare. To try to make life easier for myself, I now program the 80x86 in one of two ways;

If all the code, data and buffers will fit in 64k, I can write the program in a 16-bit segment. ('.COM')

If code, data and buffers will not fit in 64k, or I need to use expanded memory, I will use a DOS extender and write the program in a 32-bit segment. I now tend to write all programs using this method,as I have a library of routines that handle memory, input, output and files. The DOS extender seems very stable, and works under DPMI, VCPI and XMS. ('.EXE')

A 32-bit segment works similar to the 68000. With reverse syntax and the equivalent instructions (the branches, set conditionally, shifts, CLR, TST, SWAP, etc.) 80386 code can look remarkably similar to 68000.

I find 68000 branches, set conditionally and shifts more logical, and CLR, TST and SWAP make source code more readable. Using MOVE/MULU/MULS/DIVU/DIVS/ADDX/SUBX/JSR/EOR/EXG instead of MOV/MUL/IMUL/DIV/IDIV/ADC/SBB/CALL/XOR/XCHG are just a matter of preference.

BTST, BCHG, BCLR and BSET (only with an immediate bit number) have been included from before 80386- instructions were added. However, I still only use BT, BTC, BTR and BTS if I use a bit field or a register bit number. xBCHG, xBCLR and xBSET are included because they take less

than half the bytes of BCHG, BCLR and BSET (but they do not set the flags properly). xBTST is included for parity.

Use of the extra instructions is optional, all of the 80x86 instructions can still be used (I like having the choice). However, BSR (bit scan reverse) and LSL (load segment limit) have been renamed (@BSR and @LSL), because of the 680x0 instructions BSR (branch to subroutine) and LSL (logical shift left). BTTST (BT), BTCLR (BTR), BTCHG (BTC), BTSET (BTS), BTSF (BSF) and BTSR (@BSR) were added because I prefer the syntax.

I tried to make the assembler as flexible as possible. There are a lot of duplicate instructions, and the same address mode can be specified in a number of ways. There are a lot of ways to do the same thing, for example :-

```
LODSD = LODS.D = LODSL = LODS.L
[BX] = (BX)
CS:[BX] = CS:(BX) = [CS:BX] = (CS:BX)
offset[address] = [offset,address] = [offset+address]
$12 = 12h = 12xh
$ABCD = 0ABCDh = 0ABCDxh
%100 = 100b = 100xb
```

Although the assembler will recognize round brackets on 80x86 address modes, (BX) is considered the same as [BX] for example, you can only use square brackets for direct memory addressing; [100] is allowed, (100) is not. It is therefore recommended that you use only square brackets for 80x86 address modes.

Differences Between CrossFire and MASM/TASM

For the purposes of this document, MASM and TASM are considered the same.

CrossFire does not LINK.

No need to define segments.
No need to define procedures as near or far.
BYTE PTR, WORD PTR, etc. are not used (.B/.W are).

Immediate numbers need a hash (#) before them, for example :-
ADD AL,4 (MASM/TASM)
ADD AL,#4 (XFire, normal 80x86 syntax)

Label offsets are handled differently :-
MOV AX,OFFSET LABEL (MASM/TASM)

```
MOV AX,#LABEL (XFire, normal 80x86
syntax)

The way you define a label on MASM/TASM affects the way it is used,
example:-

(MASM/TASM)
LABEL DB 0
MOV LABEL,1 move byte to LABEL

LABEL DW 0
MOV LABEL,1 move word to LABEL

MOV BYTE PTR LABEL,1 override LABEL type,
move byte
MOV WORD PTR LABEL,1 override LABEL type,
move word

(XFire, normal 80x86 syntax)
MOV.B [LABEL],#1 move byte to LABEL
MOV.W [LABEL],#1 move word to LABEL

- The file continues...........
--------------------------------------------------------------------------------

Now the thing is with all this is :-

The assembler is very much finished in the sense that we use it all
the time, but more output filetypes and features could be added but
as yet we don't have any use for them. Constant use means fewer (if
any) bugs and many improvements - this is not just an end user
product.Its a ongoing production tool. If you can provide the
technical reference for filetypes or features - within reason these
can perhaps be added.

We use Pmode by Thomas Pytel (aka TRAN - thanks TRAN) which has been
converted to our hybrid format for ease of use and modification, as
our dos extender together with a pretty extensive pmode Dos call
library. This will be supplied too.

I think that a fair few people would be interested in it, he does not.
Hence the DOCs are not finished because he can't be bothered, he does
however have a working evaluation copy running (limited source
capacity). Okay okay so its crippled, but given the measly amout he
wants for registration I think this is fair.

Penciled in is a provisional registration fee of only £10
(UK pounds about $17.50 US) or £25 including the full source code.
Thisis only provisional - but no way is it not going to cost you $40
or more like some s/w apps.

Maybe some mail will arouse his interest again so:-

IF YOU HAVE ANY INTEREST IN CROSSFIRE - MAIL ME @
```

dave@flavious.prestel.co.uk

Note this is a quick lashup excuse spelling.

4337. 256 colors on the Falcon

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-05 00:00:00 UTC
From: greg_evans@delphi.com
Message-ID: <x3NWkn9.greg_evans@delphi.com>
Source record: 7881

I am not a GEM programmer so I am asking this question, partly out of ignorance and partly out of frustration.

Why do programs which work fine i 16 color mode have problems or refuse to run in 256 color mode on a Falcon? Examples, Outline Art 3 runs but can't display the graphics. SARA runs but refuse to display images. WICOPAGE (an icon displayer) says "sorry I can run in 256 colors". Why does a program have a hard time when it has _more_ colors than it needs? Why not just use the 16 colors it wants to use and just ignore the rest? What am I missing?

Greg

This is a large posting in a german news group. I won't confuse all readers
of c.s.a.programmer with a german text. If your newsreader is able to search
for a message-ID, the infos above should be enough.
If your newsreader is unable to catch the posting (maybe its already deleted)
you can use DejaNews:

http://www.dejanews.com

Please enter "Rainer Wiesenfeller Auswertung TOS" (without quotation marks)
as search string.

Remark: All hardware listed in the opinion poll must be used with atari
TOS compatible software. Each 'X' stands for one of the 85 votes.

>(definately true for Magic 2 - it returned 1.62 on an STE when tested.)

Hhmm. In which way do you request the OS version?
Looking at $FC0000 or $E00000? Why don't you use _sysbase at $4F2?
If I boot up MagiC 2 on TOS 1.04 and look at $FC0002 I get $0104,
if I look to the OSHEADER structure pointed in _sysbase, I get $0200,
date 10.08.1993. That's the same like it shows you the GENERAL.CPX.
This method (using _sysbase) does also work with image files.

(If you need a source code, I will post it, it's 2 KByte C code including
comments...)

>This makes it impossible to have values for both Magic and TOS in

>effectively... not bad fo 1987)

What certain frequently used routines and addresses are used by STOS?
Why not divert them to a documented way to access the OS? (I mean the
trap routines of definatly all atari TOS versions.)

"Using the OS version number to determine the location of undocumented
variables is not acceptable. You have been warned."
(Pexec-Cookbook, Atari Corporation, 19.03.1991)

char* strtok(char* s1, char* s2)

strtok has an internal static pointer which it uses to keep track of
the remainder of s1. When you pass s1 as non NULL it initialises this
pointer. Subsequent calls with s1=NULL cause it to use the internal
pointer. That was a (general) summary of my docs. Another thing my
strtok does, is scribble nul chars over the string. Any mention of
this in ansi? I guess the only other possible mechanism would be this? ...

p = strtok(s,"|");
while (p) p = strtok(p,"|");

>However, it works fine with Pure C, stopping at the right spot.

Wierd! My strtok is from Mark Williams C which is mostly K&R but was
moving toward ansi as best it could, considering the standard was not
finalised.

I'm beginning to suspect the mechanism has changed and that I have the
old mechanism. In addition, it appears to be buggy as well!

Is there any good documentation on how to play samples on the ST/STE/F030/TT?
I have read my Compendium but still don't have a good idea of doing it, it
states that the ST range have hardware to play sound samples. There are WAV,
AVR, SND format of sound samples. So which format does the ST understand?

Appreciates any help to understand this.

Thanks
William

Depends where you are. Hi-Soft handle it in the UK. Of course, first you
have to persuade them to talk to you....

Regards
Martyn

It's known as the "Calamus mentality".

This translates roughly into "I am doing everything myself, irrespective of whether the hardware already has the functionality".

It is also a hangover from the old days when you essentially had to program the hardware directly for speed (as the system code was usually too slow or buggy to rely upon), or added functionality in your app), and any hardware which differed from what was known when the app was written was deemed "unsuitable".

>limits.h.

Yep Hans, I wondered if I ought to say anything myself - guess I
should have but I couldn't think how to say it in non technical terms
yesterday! Here's today's effort ;-) ...

Firstly, people ought to check with their compiler manual. Like any
language, there is no guarantee a particular datatype on one compiler
uses the same amount of space as the next compiler. 'C' tries to help
with this by having certain rules. Basically, the fundamental unit of
storage is 'char' - all other datatypes use x amount of 'char' for
storage. You can also assume this ...

'short' always uses the same or more space as 'char'.
'long' always uses the same or more space as 'short'.
'int' is either 'short' or 'long' - see your compiler docs for which.

There is a function to help deal with this called sizeof(). It returns
the number of 'char' units required to store the datatype, even ones
you make up yourself. Thus sizeof(char) is always 1, sizeof(short) is
always >= sizeof(char), and sizeof(long) is always >= sizeof(short).

There's still a problem. We do not know how big a 'char' is. This gets
into the realm of portability - a complex and vague issue so I'll be
atari specific now ...

sizeof(char) = 1 byte.
sizeof(short) = 2 bytes.
sizeof(long) = 4 bytes.
sizeof(int) = either 2 or 4 bytes.

This little program will tell you how many bytes an 'int' needs in
its signed and unsigned states ...

```
main()
{
printf("6\n",sizeof(signed int));
printf("6\n",sizeof(unsigned int));
}
```

In almost all cases there will be no problem - the compiler will sort
it out for you. Those of you with K&R compilers will have to be a
little more careful though because the compiler cannot tell if you are
passing garbage between functions.

One area to keep an eye on is printf() and similar functions like
fprintf() and sprintf(). A common cause of error is something like
this ...

```
main()
{long l =5;
```

```
printf("6\n",l);
}
```

Now, this may or may not work depending on your compiler *but* in
either case it _is_ 'broken'. There are three fixes ...

```
/* if you really wanted to print a long */
main()
{long l =5;

printf("6\n",l);
----------^------------ long decimal
}

/* if you really wanted to print an int */
main()
{int l =5;
-^^^------------------- declare it properly
printf("6\n",l):
}

/* if you want a long printed as an int */
main()
{long l =5;

printf("6\n",(int)l);
---------------^^^^^--- forces the compiler to convert it
}
```

See, just shows how powerful 'C' is - three ways to fix two lines of
code! ;-)

No, just a little confusion.

My STOS Falcon extension will load 24-bit TGA images, however they are
converted down to 16-bit for display with standard Falcon hardware. There
is no reason why you couldn't write a routine that would do something simular
to the Apex file viewers from Doug Little to display in 24-bit though.

Ah, but its not /me/. Well, it is now. STOS wasn't written by me,
and the original authors chose to do it the bad way ($FC0000/E00000).
My new version 2.07 which has just been started in beta testing
has had this modified to use _sysbase (I was shocked they weren't
using this). This has been tested on the GEMulator demo with image
files, and seems to work (a couple of minor bugs still to be ironed
out)

> If I boot up MagiC 2 on TOS 1.04 and look at $FC0002 I get $0104,

> This method (using _sysbase) does also work with image files.

Oh? I was told this doesn't work... in that case, Magic can now be
done... :)

BTW I dont have any versions of Magic, so this is all second hand
info.

> What certain frequently used routines and addresses are used by STOS?

things like the address of the ikbd handler, line-a graphics routines
and others. Get STOS Fix 2.7/3.0 and it will list all of the routines
it looks for, and the addresses found for your OS.

> Why not divert them to a documented way to access the OS? (I mean the
> trap routines of definatly all atari TOS versions.)

Yea, could do this. I am investigating ways of removing the TOS table,
but not just yet...

> "Using the OS version number to determine the location of undocumented
> variables is not acceptable. You have been warned."

Yea, I know. Looking for AES 4.0 isn't good enough either for testing
for a 'new' AES. - you should use appl_ginfo (or whatever it is) under
Magic/MTOS - despite that this is documented in the Atari compendium and
others as not available until AES 4.0 (magic=3.99). Bad.

Yep.

> That's begging for problems.

Yes, I agree. However,

> As you can create new tables for STOS you seem to know exactly which
> adresses are needed.

Well, actually I am using a (clean GEM based) program that another STOS
hacker wrote a while back. I have no contact for him, and I believe that
he has left the Atari without distributing his source.

> Can't you patch STOS in such a way that the table is filled
> in at runtime?

Not with the routines in use currently - as the routine to detect the
joystick address requires the user to move the joystick. Maybe this code
could be added for unrecognized OS versions...

> So when the program is started first your code is filling the
> tables with the right adresses and after that starting the rest of
> the program?

Yea, I will investigate if this is possible once I have got a couple of
other things sorted. (btw. STOS 2.07 will not corrupt the screen upon
exiting to a Falcon screenmode, so STOS can now be run from 640x480x256
without problems - no need to switch to ST-Low)

William Wong wrote:
>
> Is there any good documentation on how to play samples on the ST/STE/F030/TT?

You have it - the compendium. If you are writing a nice clean app, then use WavePlay(), and insist they have SAM isntalled. On a Falcon you can use the OS calls - see my WWW pages for info on this. On an STe/TT you'll have to access the hardware registers directly.

> I have read my Compendium but still don't have a good idea of doing it, it
> states that the ST range have hardware to play sound samples.

The original ST[f|m|fm] doesn't really have sample playback ability - it can be done, but is quite tricky. Use STe and above hardware as a minimum IMO.

> There are WAV,
> AVR, SND format of sound samples. So which format does the ST understand?

Tbere is no major diference between the above formats. The main difference is approx. the first 128 bytes - ie. the header info. The actually sample data is stored in the same way (almost) - just the header (ie. the bit which gives the sample name, frequency, midi note etc.) is different.

The ST doesn't 'understand' any of format. If you interpret the header correctly then you can simply set up sample hardware to play the actual sample data.

That wasn't a terribly good/consise description, but I hope it helped a little.

```
m > In Pure C floats and doubles are the same thing.

You mean doubles and long doubles are the same thing. floats are
still 4 bytes.

Even more confusing, sizeof(double) varies depending on the compiler
options. Normally, sizeof(double) == 10, but when using the FPU
sizeof(double) == 12. The accuracy doesn't change, but the FPU uses
the extra 2 bytes during it's internal operations.

```
S > Look for a prog called JARxxx, best to do a search on JAR*.*

Are you sure JAR is freeware?

BTW, it does more than just install a cookie jar. I believe it uses
a function pointer or trap intercept to implement additions and/or
searches. Ask Dan Wilga for details.

/* ****************************************************************
Install cookie jar
**************************************************************** */
COOKIE = $5A0 ;cookie jar pointer address
SIZE = 32 ;max number of cookies (can be anything)

TEXT
start:
pea init(PC)
move.w #38,-(A7) ;Supexec(init)
trap #14
addq.l #6,A7

clr.w -(A7)
move.l #SIZE*8,-(A7)
move.w #$31,-(A7) ;Ptermres(SIZE*8,0)
trap #1

init:
lea start-256(PC),A0 ;use basepage for cookie jar
move.l A0,COOKIE
clr.l (A0)+ ;initialize cookie jar
move.l #SIZE-1,(A0)
rts
END

>
>An int is guaranteed to be 16 bit, 32 bit many compilers, like Lattice C, use
>32 bit ints.

There is, however, a switch in Lattice (and in GCC for that matter) to make
an 'int' 16 bit.
(WARNING! The Lattice C optimizer often does some incredibly stupid things
when it tries to optimize code which uses 16 bit numbers. You might even
be better off with no optimization at all...)

The range for a 16 bit (2-complement) number is -32768 to +32767, by the way.

Normally, an 'int' should be the 'natural' integer type for the machine in
question. Unfortunately, the older members of the Motorola 68k series (like
the 68000 in the STs) are only 16 bit internally (except for the registers),
while having a 32 bit instruction set architecture (ISA). This is probably
the cause for the confusing compiler differences.
(The PCs with their 80x86s have the same problem.)

And again, the second range figure should end with a 7.

> > character | char | 1 byte | non numeric values

'non numeric'?
There are lots of cases where it's very useful to use characters in the
same way as any other number type. C makes no distinction.

> > | -128 to 127
>
>Compiler specific, some compilers use unsigned chars by default, other use

>signed chars by default.

And many can change that via a switch.

Also, a character may well be longer than 8 bits. You won't find any Atari compiler where that is so, though.
(I've heard of 9 bit and 64 bit character machines, but those are not something I would worry about. ;-)

By the way, you forgot to mention 'short' (perhaps not very surprising if you're using a compiler that has a 16 bit 'int' ;-).
'short' is at least 16 bit and no longer than an 'int'. On machines where the latter is 32 bit, 'short' is often 16 bit to make a more space efficient type available. It can be slower to do calculations with 'short', though.

Length of char <= short <= int <= long.

(GCC also has 'long long' which is 64 bit, but that's not standard.)

What tokens do strtok() return (add a puts(p) in the loop)?
I mean, does it get past your '\0' after having considered ' line1 '
and ' line2]' tokens?
(Wouldn't you want to include ' ' as well and break up at ']'?)

If the second token is indeed what I wrote, it appears the strtok() needs
more than one '\0' to stop and you're just lucky to have an extra one after
the string. That would of course make the strtok() quite buggy!

You should find sources for strtok() in the GNU libraries.

...but shouldn't if you only use the specifiers mentioned here.
(%c, %d, %f)

>program to see what happens. Another question you probably have is: why

In case there's someone here who doesn't know very much about how computers
(and C in specific) work internally:

C has _no_ way of knowing whether you actually passed the floating point
or whole number you state with your specifiers that you want to display.
Therefore, printf() can not convert the float 3.14 into the whole number 3
for example and a line like

printf("Pi=%d", 3.14);

will print gibberish.

The vast majority of C functions you will ever write and use can not handle
parameters of varying types like printf(). Without the specifiers, printf()
wouldn't have any idea about what, or even how many, numbers you sent it.

>are character values stored with whole digit numbers from -128 to 127.
>The answer is that the numbers correlate to letters using a lookup table.

In case someone wants to know about the 'lookup table', the Atari machines
use a standard called ASCII (American Standard Code for Information
Interchange) as do most other modern computers.
This covers the English alphabet, numbers and the normal special characters.
For foreign and other special characters, the numerical codes may differ.
(The normal standard only covers the character codes 0-127.)

>Try adding the following code to the above program:
>
>printf("\n %c%c",72,73);
>
>In the above line of code I didn't give printf() a character that the

>format specifier %c calls for. Instead I gave it a whole number.

I think it should be mentioned that C does not really have characters in the usual sense (for example BASIC). 'A' may look like a character to you, but C will only interpret it as the _number_ 65.

As I guess will be seen later in this course, C has no strings either. Instead you use functions that operate on lists of numbers under the assumption that they are strings.

The rsrc_gaddr() function *does* work entirely as specified in the GEM documentation - that is, it will find any of the specified objects in a resource file, given that you have their index.

As I don't have the article that started this thread, I can only guess that what you want to do is change the te_ptext field of the TEDINFO structure.

The TEDINFO structure may be found by:

```
(TEDINFO *)(tree[obj].ob_spec)
```

This may then be dereferenced to obtain the te_ptext field:

```
((TEDINFO *)(tree[obj].ob_spec))->te_ptext
```

te_ptext is simply a pointer to a C-style string, and may be altered or manipulated as you see fit. I seem to recall that there may be a text length field in the TEDINFO structure... but I can't quite remember (my documentation is in my hall of residence, and I'm sitting at a Sun Sparc machine typing this).

I know this sounds *really* nasty, but you could try modifying
the active process system variable (in the OSHEADER structure)
to point to the basepage of the accessory, then using malloc()
or mfree() (or whatever), then setting it back to whatever
it was to start with. This should ensure that your accessory
owns the memory. It may work for file handles as well.

The thing is, I haven't tried this, and I don't know whether
it works, but if it does work on non-multitasking systems
(which are, after all, the only places where it would be
used), why not do it?

I run a 660C (about a year old) on a Falcon. No problems in this
department but I seem to remember it only affected some STs.

> Now HP has the fancy DOS/Windows GUI control panel for their newer models. Does
> this eliminate those models from being used by Atari STs?
>
No they work fine. The only problem is that it is almost impossible to
change the factory settings since there are no dip-switches. This is a
problem mainly in Europe since the paper size defaults to American
Letter rather than the European standard A4. It makes about an extra
inch at the bottom of each sheet unprintable.

Hope this helps

Regards
Martyn

Where are the 24 bit sprite routines? And 24 bit drawing routines? My guess is there are no language extensions yet that work on true color (24 bit) graphics cards. So you are talking and thinking a bit too simple now. I even wonder if a STOS program like this will work on a true color card in an ST (or TT ot Falcon or ..).

```
10 print "Hello world!"
20 end
```

The constant CHAR_BIT in limits.h tells you how many bits there are in a char.
Usually it's eight.

>
> sizeof(char) = 1 byte.
> sizeof(short) = 2 bytes.
> sizeof(long) = 4 bytes.
> sizeof(int) = either 2 or 4 bytes.

> printf("6\n",sizeof(unsigned int));
> }
>

Well Mr Harrisson, you made a mistake overhere, this program will print when
compiled and runned:
6
6
Not very usefull I think. Let's do it this way...

```
#include <stdio.h>

int main(void) /* main has to be of the type int according to ANSI */
{
printf("%i\n", (int)sizeof(signed int));
printf("%i\n", (int)sizeof(unsigned int));
return 0; /* exit succes */
}
```

The operator sizeof() has an result of the type size_t, the type of size_t is
compiler dependent. That's why I cast the answer to an int.

> In almost all cases there will be no problem - the compiler will sort
> it out for you. Those of you with K&R compilers will have to be a
> little more careful though because the compiler cannot tell if you
> are passing garbage between functions.

For those who don't know: there are two main streams in C compilers, the older K&R compilers and the newer ANSI C compilers. The main advantage of ANSI C is that there are function prototypes, so the compiler can check wether you are passing variables of the right type to a function.

The K&R compilers are called K&R compilers because the compile C the way it was defined in 'The C programming language' by Kerninghan and Ritchie. ANSI C compilers are implemented according the ANSI C standard. A good book about ANSI C is 'The C programming language, second edition' by
Kerninghan and Ritchie.

Those books by Kerninghan and Ritchie are usually reffered to as K&R. To avoid any confusion about which book you are reffering to you can use K&R1 and K&R2 for the first c.q. second edition.

```

Eh??? It's well defined where the joysticks are. They are in the
keyboard. The ACIA will receive a joystick packet when a joystick is used.
(First byte comming from the keyboard is $FE for joystick 0 and $FF for joystick
1, the second byte has in bits 0-3 the four directions and in bit 7 the
firebutton status.)

Why didn't you include assembly in this thread? It's even harder to do a game in assembley then in C. So there was no danger to include assembley too in the thread, because it's far easier to program in basic then in assembley.

No Tony, I think you are moving the goal posts here. C is the better choise for game programmers because you can do better games in C then in STOS basic. There was never anything about ease of use and suitable for starting game programmers. Those arguments came when it became clear to you C could indeed do a better and faster game then STOS.

Do you remember you asked me to SHOW you a game written in C that was better then STOS? This clearly means to me you were interested in the results of the programming language, and not in how hard or easy it is to write a game in that particular language.

You don't win sweet FA until you show me a good game written in 96 in
C....and that cannot be done,

so C loses the argument, the debate and the whole thread, and you
have what we call "Egg on your face" for shouting you win, it is
pathetic to think you can win a debate like this with unproved
arguments,
All you C coders that have entered this debate (other BASIC owners
wimped out!) are full of talk, too busy talking to prove your
arguments with code...pathetic

> > ...actualy the thread is best BASIC or C to choose

snip

>Why didn't you include assembly in this thread? It's even harder to do a game

eh?, because we already know that asm is best?...how many people are
going to learn asm to make a game, the worry for most people is that
after taking all the time it needs to learn asm, then be good enough
to make a game, will there be a big enough audience left?

But I could show someone with NO programming knowledge , how to make
a good game in a fraction of the time, most of my time learning to
program has been taken up with lots of trial and error, I could now
pass on the...well you know :)

>No Tony, I think you are moving the goal posts here. C is the better choise for
>game programmers because you can do better games in C then in STOS basic. There

eeerm we don't know that yet, you showed me a demo of a game, this
looks like it will be better, but is not yet?, it is also not fully
compatable, your main argument has always been compatability, you
showed me what could be good, you have not yet showed me anything
BETTER than heartland,
I stopped asking you to show me so you had a chance, but YOU are
bringing this up again,

You have not shown me anything better than heartland, only shown me something that could be better? until you do then maybe you better stop saying C is better for making games than BASIC before you start looking silly?

Cheers.............!ynoT

Hi Bill,

the STE/TT/Falcon range can playback AVR sounds at unstandard
Atari-specific frequencies. WAVes can also be interpolated by
some softwares, but ultimately, AVRs recorded at 6, 12, 25 or
50KHz are what works on Atari machines equiped with DMA sound
support. A place to start is to get the System Audio Manager.
It was included on Falcons delivered with internal HDs and it
will also work with STE/TT. SAM installs a cookie and enables
the Waveplay() command for calling AVR playbacks on programs.

Try to see if you can locate SAM and the developers kit or if
you cannot source it locally, e-mail me back. I'll see what I
can do about e-mailing you a copy of both along with some AVR
utilities for converting AVR to WAV or AIFF. Good luck!

Regards,

Depends on the compiler. MWC uses the DECVAX format where
sizeof(float)=4 and sizeof(double)=8. Most MWC floating point
functions use double as arguments for the extra precision.

But who wants to use floating point anyway? <G>

It is included as part of the Geneva and NeoDesk 4 demos, available from www.pair.com/gribnif . Yes, it is freeware, and developer docs for the function calls are available upon request (they are included with Geneva and NeoDesk 4).

g > I'd rather Malloc() a block of RAM

After you call Ptermres(), the OS regards your program, basepage and all, as just another Malloc() block. To call Malloc() you would first have to call Mshrink() to free up some RAM for it to allocate. This approach is both simpler and causes less memory fragmentation.

Admittedly, the more you mess around with the basepage, the greater the risk of modifying something the OS actually uses, but I seem to be able to get away with this one.

g > And, you have missed out the "unjar" code which should be
g > executed during system reset.

You only need to do that if you are going to check for an existing cookie jar at boot time. As you may have noticed, this program wipes out any pre-existing cookie jar (so don't use it if you don't know whether or not you already have a cookie jar).

Message-ID: <19970108021400.VAA19809@ladder01.news.aol.com>
Source record: 7831

Take five minutes to read this and it WILL change your life.

I've been a fool so far. Yes, I admit it I've been a fool. I've
been doing this on local BBS's for the last 2 years. I've been
getting about 40 to $50,000 a year if that. I tried it the net
3 weeks ago and I wouldn't believe it! Not just a little each week
(barely enough to keep my head above the debt), but tons, I mean
big bucks! In the first week I got three hundred dollars, then a
week later, a couple of thousand, and by the end of the third week,
I had recieved nearly $32,000.00.

It's REALLY SIMPLE to do too!!!

Here's all there is to do:

STEP 1.

Invest your $5 by writing your name and address on five seperate
pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING
LIST."
(In this way, you're not just sending a dollar to someone; you're
payingfor a legitimate service.) Fold a $1 bill inside each paper,
and mail them by standard U. S. Mail to the following five addresses:

1-Sam Coice
25550 Buckthorn Ridge Rd
Pioneer Ca 95666

2-Peg Vickmore
14905 Highway 88
Jackson, Ca 95642

3-Brian Hyson
4278 Sayoko Cr
San Jose, Ca, 95136-2335 USA

4-Daniel Hanlon Jr.
6001 Fox Run
Fairfax, Va 22030

5-Joe Munchak
13535 Union Village Cir
Clifton, Va 20124

STEP 2.

Now remove the top name from the list, and move the
other names up. This way, #5 becomes #4 and so on.

Put your name in as the fifth one on the list.

STEP 3.

Post the article to "at least" 250 newsgroups. Rembering that the more that you post on, the more people see it, and the more you will get. There are at least 30,000 newsgroups at any given moment in time so don't be stingy.

STEP 4.

You are now in business for yourself, and should start seeing returns within 7 to 14 days! Remember, the Internet is new and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back about 5 responses. Yes, thats right,only 5. You make $5.00 in cash, not checks or money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250 additional postings with your name at #4, 1000 postings. On average then, 50 people will send you $1.00 with your name at #4,....$50.00 in your pocket!

> END
```

Personally, I wouldn't overlay the new jar over the existing basepage of the TSR. I'd rather Malloc() a block of RAM (sizeof(current jar + 8 cookies), as is reccomended) which will remain allocated and owned by the TSR when it goes resident.

And, you have missed out the "unjar" code which should be executed during system reset.

4391. cross-GCC on Linux

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-08 00:00:00 UTC
From: Levien van Zon <lvzon@bio.vu.nl>
Message-ID: <Pine.SOL.3.95.970108125348.27827A-100000@ursus>
Source record: 7834

Hi everyone,

I am currently trying to set up a cross compiler to produce atari bins on a
i586 based Linux system. Has anyone got some experience in setting up
cross compilers, because I could use some help...

I use an i586 based PC (sad but fast) running Linux 1.2.8 (temporary,
until I fix GCC to run with a 2.0.24 kernel) and GCC 2.7.2 as a host,
and a Falcon 030 running FreeMiNT 1.14.2 as a target (although I
have configured the GCC cross compiler to make plain 68000 binaries)

I am using the following (Atari-) packages ("*" running on Linux, "o" on Atari)

* GCC 2.6.3 for MiNT (patched source tree)
configured using ./configure --target=m68000-mint

o GCC 2.6.3 for MiNT (binaries used for compiling libgcc1.a on my Falcon)

* Binutils 37 (3.7? or 0.37? or 0.3.7? or pl37??)
(sources by J.Bammi, pretty old I think...)
compiled using Makefile.cross with -DBYTE_SWAP and -DWORD_ALIGNED
(came in a .zoo file called utlsrc37.zoo)

o Binutils (unknown version, no docs. I think it's 37 again...)
(binaries, to use with GCC binaries)
(came in a .zoo file)

* GAS 1.37 pl 4 (I think) (sources from J.Bammi)
(came in a *%#$@&! .zoo file called gassrc04.zoo)

o GAS 2.x (don't know the exact version)
(binary, to use with GCC binaries)
(came in a .lzh file called gas2<something>.lzh)

I also have the libgcc.a from the GCC Atari binary distribution
and the Assembler sources for libgcc1.a for Linux68k, although
I think these sources use the FPU, which I don't have...

Problems (list of 2 Gb follows :-) :
----

* Atari Binutils compiled for Linux won't recognise object file format
produced by GCC binaries on Atari. "ar" _does_ handle the archives.
(Atari Binutil binaries running on Atari _will_ recognise obj format)

* GAS 1.37 only supports 68020 + FPU

* GAS 2.x bins are compiled for 68030 + FPU according to docs,
but seems to work fine on my Falcon without FPU.

* I'm not sure libgcc1.a was made correctly, since I couldn't use the
Makefile

* The GCC make process aborts _after_ having handled libgcc1.a, because
libgcc2.c and a few other things won't compile correctly.
I think this is either due to faulty (cross-)Binutils or due to
a faulty libgcc1.a

So I guess I will need at least the following:

* Source distr of a GAS which can output mc68000 TOS binaries

* Source distr of Binutils that can handle object files compiled by
GCC 2.6.3 for Atari (OR patches for the GNU Binutils to implement
a m68000-atari or m68000-mint target)

* A libgcc1.a for m68000-mint (in case the one I compiled isn't any good)

If anyone can help me with advice or by telling me where to get some of
the stuff above, I would be very grateful...

Thanks for reading...

I see the stos vs c vs assembly argument is still going on, my view is
if a game is fun does it realy matter what language it was written in.

this comment is more directed at the people who dont beleive stos games are
good at all, I have found several games written in stos/amos to be quite enjoyable
and people shouldnt judge a game but how it was programmed(if its fun)

correct me if im wrong but i beleive Ultima I and Ultima][were written primarily in
basic with a few assembly routines(original apple versions) and even by todays standards
I find both of these games to be in my top 10 list of games ever.. along with
Starfleet I from interstel which the ibm version was written in basic, have the sourcecode
and no assembly calls made. the atari/amiga and mac version i beleive was rewritten in 'c'

as i am now only getting in to the atari scene, what is the best version of c
for the atari, ive used lattice c on both amiga/ibm.

I think the ALU of the 68000 is only 16 bit, register to register addition of a long take 8 clockcycli, while a word addition only takes 4 clockcycli. So I think that Johan Klockars is right with his statement.

Has anyone with a TT use a patch program called TT GAME which makes the TT play ST games?

I downloaded it from a BBS sometime ago to look at it, just to see if I can get a game I'm writting to run on a TT. I still have STOSfix 1.1 which supports TOS 3.x on the TT so I'm wondering...

If the thing works, then might be good playing ST games on DirecT/40 or Medusa...especially if it has a PC card for running Windoze 95 and DOS games as well :)

Great, this'll make the C newbies believe that int, regardless of machine,
is always 6 bytes ... ;-)

They should better try :

main()
{
printf (" Signed Int is %d bytes\n",sizeof(signed int));
printf ("Unsigned Int is %d bytes\n",sizeof(unsigned int));
}

Reading all your other lines, each missing the format specifier, but all
having a `6' I guess you have trouble uploading the `%' character ?

Cheers Peter

> (The PCs with their 80x86s have the same problem.)

This is wrong. Even the 68000 is 32 bit internally. Instructions like
adding 32 bit numbers would take far more time if this were not the case.
Turn it around, then it makes more sense : The MC68000 is a full 32 bit
processor that has a 24 bit address and 16 bit data bus interface. The
notion of the 68000 being 16 bit architecture was only stated by Intel
fans at the time who could not stand that Motorola had the more advanced
CPU. I quote the Valvo databook :

DESCRIPTION
The SCN68000 is the first implementation of the S68000 16/32 bit
microprocessor architecture. The SCN68000 has a 16 bit data bus and 24
bit address bus, while the full architecture provides for 32 bit address
and data buses. ...

Got it ?

Cheers Peter

I was just wondering about BUS errors. I own a DirecT60 Hades clone. Sometimes when I am using CAB, I will try to got to a certain website and I will get a BUS error. I then hit return and I am at the desktop. I was wondering if the fault lies with the T60 or is it that if the website was formed using Netscape, then it might be that CAB in incompatible with the html doc it is trying to load.

> AVR, SND format of sound samples. So which format does the ST understand?

The ST hardware cannot play samples. However, it is possible (but very
tricky) to emulate STE hardware on the ST.

The STE/TT hardware can only play raw signed 8-bit sample data.
WAV, AVR and SND are file formats. That is, different "standards" of storing
samples on disk. To play a sample file you need to read the file to memory
and "decode" it into signed 8-bit samples.

The F030 hardware can play both 16-bit and 8-bit signed sample data.

It seems it does. It is nasty, and I do not recommend it for any case where things can be done without it.

> The thing is, I haven't tried this, and I don't know whether

Interesting enough, occasionly you need it in multitasking systems too. When designing the new STiK we came across a problem that seems to require the method for a solution, even with multitasking.

Cheers Peter

Tell you : Those who want large arrays of floats. I once had to use a array
of

float psi[400][200][100];

Do I need to tell you the difference if I exchanged the `float' by
`double' ?

Cheers Peter

Not very likely...

: if the website was formed using Netscape, then it might be that CAB
: in incompatible with the html doc it is trying to load.

Even more unlikely..

I's probably just a bug in CAB or in the TCP/IP drivers (STiK I presume?)
or the overlay. Try Downloading the newest version of CAB and STiK, maybe
the errors wil go away...

4406. Re: cross-GCC on Linux

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-09 00:00:00 UTC
From: lvzon@bio.vu.nl
Message-ID: <5b2p4g$dld@balaena.bio.vu.nl>
Source record: 7751

I (lvzon@bio.vu.nl) wrote:

: * Source distr of a GAS which can output mc68000 TOS binaries

: * Source distr of Binutils that can handle object files compiled by
: GCC 2.6.3 for Atari (OR patches for the GNU Binutils to implement
: a m68000-atari or m68000-mint target)

These binutils are giving me a headache!
I was looking through the newest GNU binutil sources yesterday,
and it accured to me that there was support for lots of targets,
including AmigaDOS, MSDOS (which doesn't come to in a lightyear of even
remotely resembling a UNIX system) and lots of systems I've never heard
of, but _not_ for TOS/MiNT.
That shouldn't be too hard to implement? So I looked a bit further,
and it appears that the main effort in implementing a new target is
to write an out-file description for the so called BDF (binary description
format?) library, which is then used in compiling GAS and the binutils.
This implementation of a new out-file format should simply be a case of
taking an existing description and editing it, at least, thats what the docs
say...

There is just one tiny problem: I don't know _anything_ about the
atari executable/object file format. So I'm looking for volunteers
to send me detailed information on this format, or to have a go at directly
implementing it (preferred, I'm a lazy bastard :), so that we can
produce an atari/MiNT target for the GNU binutils... Anyone?

Thanks...

Mainly because a lot of TOS programmers were either lazy and took shortcuts in their programming (ie. Not using standard TOS calls) or they were innovative and found a way to make the machine so somethine it wasn't supposed to.. which makes the application not 100 compatible all the time. I can't speak for those apps in particular, but a lot of Atari apps are like that...

In article <x3NWkn9.greg_evans@delphi.com>, greg_evans@delphi.com says...

If I remember correctly, this is exactly what I did in Edith Pro
for the Atari. Change _p_run only when running as an accessory,
and not when under MultiTOS. I don't remember if it was harmful
to do so anyway.

If you want to see some cookie jar code, have a look at the source for TAPEBIOS (should be on umich). this is a SCSI streamer program, but it installs a cookie for itself.

It checks for the existance of a cookie jar & expands its size if found, or creates one if needed.

No, it's not wrong. The 68000 _is_ 16 bit internally.

>adding 32 bit numbers would take far more time if this were not the case.

It _does_ take longer.
Check your instruction timing tables for any 16 bit vs 32 bit operation
(not move) between registers (so no memory access is taking place).

For example, a simple data register to register add takes 4 cycles for
byte or word while it takes 6 (or rather 8 on an Atari) for long.
This is because the ALU is only 16 bit wide.
On an '020 and up, the operations take the same time. Guess why?

>Turn it around, then it makes more sense : The MC68000 is a full 32 bit
>processor that has a 24 bit address and 16 bit data bus interface. The

While you are correct about the external busses, the fact remains that
the 68000 is a 16 bit implementation of a 32 bit architecture.
There's nothing strange about that.

>notion of the 68000 being 16 bit architecture was only stated by Intel
>fans at the time who could not stand that Motorola had the more advanced

When you only speak about 'architecture', you normally mean instruction set
architecture, of which the 68k series has indeed always had a 32 bit one.

>The SCN68000 is the first implementation of the S68000 16/32 bit
>microprocessor architecture. The SCN68000 has a 16 bit data bus and 24
>bit address bus, while the full architecture provides for 32 bit address
>and data buses. ...

But that quote says _nothing_ about the internal implementation.
You could do a bit serial 68000 if you wanted, which still would look
just the same from the outside.

```
It was said that the C compiler removes all the blanks before
processing. While there are languages where that is true, C is not
one of them.

The following are all legal C code, but with completely different
results:

static char ge;
static charge; /* implied int */

a = b++ + c;
a = b + ++c;

a = b && c;
a = b & &c;

Basically, blanks are used to separate operators from operators and
names from names. Blanks between names and operators don't matter.

char *p;
char* p;
char * p;
char*p;

>processor every week.

In the ST world, yes pure assembly is the best way to go for games. But
if you're a good programmer, then you can get the same results from STOS.
You can even add assembly routines to make it even better and faster.

In the PC world however...the real reason why we have to upgrade to bigger
computers is simply because commercial programmers are too lazy to write
efficent code. This pratice has been "blessed" by MonkeySoft because,
however sad it is, Billionaire Bill setted the standard for the software
industry.

In an old article of Id software, they said that they used only C++ in
Doom and it would be pointless to use assembly which wouldn't improve
things majorly. Well, it's because they are real good at
programming...but when someone else also uses only C++, they may have just
slopped it all together for all we know. Dave Perry in the latest issue
of Next Generation recommends using assembly even on RISC machines which
gives a speed improvement. It's little things like this that sets your
product over the competetion.

>
>I see the stos vs c vs assembly argument is still going on, my view is
>if a game is fun does it realy matter what language it was written in.

All languages have their good points and bad points, so this big debate is
really pointless. There's nothing wrong with having STOS, C, and an
assembler at the same time. :)

> this comment is more directed at the people who dont beleive stos games are
>good at all, I have found several games written in stos/amos to be quite enjoya
>ble
>and people shouldnt judge a game but how it was programmed(if its fun)

Case in point...Wacko Software and Stosser both make games in STOS basic.
Same language. If you play any of Wacko's games, then you know know the
idea of "crap" is much more than just an abstract concept. Stosser on the
other hand makes brilliant games IMHO. He knows how to get the most from
STOS, the correct techniques of coding, and have the right tools mainly
Missing Link extension. If you didn't know he wrote them in STOS, you
might have thought they were in assembly.

The moral...don't say, "Ugh...STOS is bad, look at this game" but rather
"Yech, this game is crap...whoever wrote this is not good at all."
Programs say alot about the people who wrote them.

Like I said, languages each has their strengths and weaknesses. I
personally would use STOS for game writting, plus being able to include
assembly routines for speed and TOS calls is a mahor plus. C is good for
Gem applications, though you can write games but they would not be arcade
fast. Yet you can get away with games that just wait for your mouse click
and look good in a window. :)

If you're real good at assembly to write a game competely in it, go for
it! It would be much faster and better if you know how to squeeze it out
of the system. :)

> bit address bus, while the full architecture provides for 32 bit address
> and data buses. ...
> ---

> Got it ?

(I see a flamewar over descriptions beginning to brew).

BTW: If I may be allowed to ad my $4.95 plus-GST: The 68000 is a 16-bit
processor - because the ALU is 16-bit, and therefore must make two passes
to handle 32-bit data as allowed by the ISA. The first 32-bit 68k member
was the '020.

There are three ways of determining the 'bit-ness' of a CPU : ALU width
and data-bus width, and internal data-path width. The most common (and, to
my mind, the most accurate) way is the ALU width, as this says how much
data it can handle in one go. It may need more than one go at the data,
but it can only ever handle ALU-width data at a time.

The second method, data-bus width is irrelevant and inaccurate nowadays.
All modern processors (040, 060, Pentium, Alpha, PPC) have data buses
wider than the ALU. In the case of the 060 (and both Pentium and 60x PPC's
for that matter) we have a 64-bit path to memory, but a 32-bit ALU,
register set, and ISA. (In the past this was a good way to compare them,
as ALU equalled bus width. [68000, 68010, 80286, 6502, 8088 all have

data-bus widths equalling the ALU width], but with processors like the 386SX you have a 32-bit ALU and ISA, but a 16-bit data bus).

The third method, internal data-path width is something else entirely. Some processors can, even within the same "CPU-name" have differing path widths internally. [BTW: I am talking things like cache-to-ALU and register-to-register]. I have minimal knowledge here, so I'll not comment any further.

BTW: For the acronym-challenged:

ALU: Arithmetic & Logic Unit. In essence this just means the "brains" of the CPU are within the Logic part, and all maths ops or register manipulations [Loading, Storing, Adding, Setting/Clearing bits etc] are carried out by the Arithmetic part.

ISA: Instruction Set Architecture. What the programmer uses to command the CPU.

Or, better yet, use Num*8 bytes beyond the end of the BSS. (I assume you
are not interested in symbol data or debug info which will immediately
follow the BSS block [if any]. Overwriting either of these will not harm
the functionality of the app).

Perhaps something like this

```
move.l 4(a7),a0 ; get basepage pointer into a0
lea __stack,a7 ; stack at end of BSS?
move.l #$100,d0 ; size of Basepage
add.l tsize(a0),d0 ; add text size
add.l dsize(a0),d0 ; add data size
add.l bsize(a0),d0 ; add size of BSS
lea 0(a0,d0.l),a6 ; "new" jar pointer
add.l #8*NUM,d0 ; add space for NUM cookies
move.l d0,savesize ; save "keep size"
move.l d0,-(a7) ; space to shrink to
move.l #mshrink<<16,-(a7) ; Mshrink & null param merged
trap #1 ; GEMDOS call
addq.w #8,a7 ; clear stack

move.l a6, jarptr

pea newjar
move.w #supexec,-(a7)
trap #14

clr.w (a7)
move.l savesize,-(a7)
move.w #ptermres,-(a7)
trap #1

newjar
; install new jar, copy old (if any) contents into new jar
; goes here, then set p_cookies system var, and return to sender
```

```
move.l newjar,$5a0,w
rts
```

> g > And, you have missed out the "unjar" code which should be

> cookie jar at boot time. As you may have noticed, this program
> wipes out any pre-existing cookie jar (so don't use it if you don't
> know whether or not you already have a cookie jar).

I found that some older systems (especially those prior to the STE - my old Mega 4 with TOS 1.02 for example) seemed to keep the old value constant through a warm reset, meaning any software which loaded earlier in the boot phase than the one who created it last time will write into unowned space, and therefore the cookies they place there will (possibly) get overwritten with random guff.

So, as an early fix to my Toolbox TSR, I added unjar code and this problem disappeared. <shameless plug> It [the Toolbox] also fills it in with correct values of many common (documented) values, and corrects TOS errors in jar contents (For example: the "I know one is there, but I can't tell which one" FPU cookie bug in all TOS 3.x and 4.x that I am familiar with).

And, of course, the only things that should write to the cookie jar are TSRs loaded from the AUTO folder at boot time. Transient apps should not. Accessories are doubtful - especially as they can be killed easily under MTOS (an early accessory of mine used CTRL-clicking the name a "I want to re-configure you" instead of "I want you to do something", whereas MTOS redefined it to mean a death-knell to the app or DA.

4420. COMPLETE Atari Lynx Development systems for sale

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-10 00:00:00 UTC
From: rochelle@umcc.umcc.umich.edu
Message-ID: <5b5hfc$dg0@umcc.umcc.umich.edu>
Source record: 7765
Cross-posted to: alt.games.lynx,rec.games.video.atari,comp.sys.atari.8bit,comp.sys.atari.programmer

Hi again,

We still have 4 systems left, each consisting of:

a Howard board
in case with the same footprint and color scheme as an Amiga 2000
the (Howdy) display unit
these are stereo enabled ... A Pinky/Mandy unit is NOT capable of stereo
full documentation
call it 3 pounds, 2 inches, or a few hundred pages... it's a lot
complete development software
9 Amiga floppies with Atari/Epyx programs, demos, sfx, utilities
1 Amiga formatted floppy with extra routines by Bastian Schick and myself
Expert technical support via email included.
Access to cartridge prototyping, production, packaging, & marketing included.

All this can be had for only $2000 + shipping each. You won't find a
better offer anywhere in the world! Atari charged developers $5000 for
these units but you get one for less than 1/2 the price.

We also have ONE Amiga 2000 with 5M RAM, 51Meg HD, WB 1.3 and the development
system preloaded on the hard drive. It's only $400 + shipping with the
purchase of a Howard board. This makes a complete (high-end) Lynx development
system for only $2400 + shipping (expect about $60.00 continental US)

Don't miss out! Just like Lynx games, these prices are NOT going to get
any lower.

}}}}}} Call Lance at Video 61 (612) 462-2500 to get yours now! {{{{{{

fine print:
1. You must supply your own monitor for the Amiga.
2. We accept most major credit cards, but the conditions are "no returns".
3. Personal checks will have to clear before shipping.
4. Units are returned from developers and sold "AS-IS". All of them
have been tested for all major functions to insure working status
before shipping.
5. The usual disclaimers about software doing what it is supposed to do,
not what you expect it to do in all cases and it's not our fault if
the UPS man drops it on your foot.
6. Any and all typos are mine...

Harry Dodgson
2600/7800/Lynx developer

4421. To all AES developers

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-10 00:00:00 UTC
From: Jo Even Skarstein <josk@ifi.ntnu.no>
Message-ID: <01bbff1b$7c6f7620$df39f181@pervo.stud.ntnu.no>
Source record: 7766

Hi!

N.AES have some new AES-calls, one of them is quite useful. I've used it in a small program that adds "virtual desktops" to N.AES. If developers of other AES'es (MagiC, Geneva, XaAES, oAESis...) could add this call the program would work with this (And a couple of others.) too.

Excerpt from the N.AES-docs...

7.7 appl_control N.AES

Aufgabe: Gezieltes Steuern von Anwendungen.

C-Prototyp: int appl_control(int ap_cid, int ap_cwhat, void *ap_cout);

Binding: control[0] = 129
control[1] = 2
control[2] = 1
control[3] = 1
control[4] = 0

int_in[0] = ap_cid
int_in[1] = ap_cwhat
addr_in[0] = ap_cout
ap_creturn = int_out[0]

Parameterbeschreibung:

ap_cid: Die Applikationsidentifikation (apid) der Anwendung, die gesteuert werden soll.

ap_cwhat: Die Art der Steuerung:

0 bis 9 reserviert f&#65533;r N.AES

APC_HIDE (10) Applikation ausblenden
Wird f&#65533;r ap_cid -1 &#65533;bergeben, so wird
die aktuelle Anwendung ausgeblendet.

APC_SHOW (11) Applikation einblenden
Wird f&#65533;r ap_cid -1 &#65533;bergeben, so
werden alle ausgeblendeten Anwendungen
eingeblendet.

APC_TOP (12) Applikation in den Vordergrund bringen (zur aktuellen Anwendung machen).

APC_HIDENOT (13) Ausblenden aller Anwendungen bis auf
die in ap_cid angegebene, welche zur
neuen aktuellen Anwendung wird.
Wird f�r ap_cid -1 �bergeben, so
werden alle Anwendungen bis auf die
aktuelle ausgeblendet.

ap_cout: Wird abh�ngig von 'ap_cwhat' vom AES gef�llt (momentan
noch unbenutzt, die �bergabe eines Nullzeigers ist
m�glich).

```
ap_creturn: Returnwert:

0: ein Fehler ist aufgetreten

Wert > 0: kein Fehler aufgetreten
```

Anmerkung:
Ausgeblendeten Anwendungen wird in der Men�leiste ein '*'
vorangestellt, es sei denn, sie hatten im Moment der Ausblendung kein
Fenster offen. In diesem Fall wird nur die Anwendung gewechselt.

Der '*' vor dem Namen bedeutet also genauer: Einige oder alle
ge�ffneten Fenster dieser Anwendung sind ausgeblendet.

Well, GCC does the same thing.
Three other 68k C compilers I've used (none available for the Ataris (yet))
have 32 bit ints as well and two of them have no way of changing to 16 bit
ints (I don't know about the third).

I always use GCC with -mshort (for 16 bit ints) myself since most Atari
machines are slower at 32 bit operations. When I use Lattice C I leave it
at the default setting to let the optimizer work.
I wouldn't dream of using Lattice C (or PureC for that matter) for release
versions of MGIF, though.

Or for that matter, you could use the DTA/command line buffer. That
way you only waste 128 bytes.

BTW, the symbol table and/or debug info is not loaded into RAM by
the system.

I suspect that the OS doesn't ever look at the basepage once the
program is loaded. It is simply used during the loading process and
as a one-way information transfer.

Actually, you can play samples on the ST using the PSG chip. The problem is that you have to write a routine by yourself just to do that. Samples are played on the STe/TT using calls to hardware registers and the Falcon uses special XBIOS calls.

Just thought I can clarify this... :)

Yep. Trouble is the older compilers may not even have limits.h and in
fact MWC does not so I thought it best to just say atari char = 1
byte.

So very true! I used the wrong Nos when posting. 0.42 has a printf bug
where printf(s) was used instead of printf("%s",s). Mike has fixed
this now but I need killfiles so I'm waiting for those before I can
use the fixed version.

I'm not very up to date with the ansi standard but I must mention that
this needs to be investigated with pre-ansi compilers. It may or may
not exist, or if existing, may not be fully ansi compliant. MWC for
instance, defines size_t as a long (32 bit); there is no %i formatter
and sizeof() returns an int (16 bit)!

Yep, Nos 0.42 has a news posting bug and I forgot all about it! ;-)

>I mean, does it get past your '\0' after having considered ' line1 '
>and ' line2]' tokens?

Yes.

>(Wouldn't you want to include ' ' as well and break up at ']'?)

The ']' yes but not the spaces. The routine in question is concerned
with dynamically allocating an OBJECT tree for a windowed alert driven
by a printf() type front end.

>If the second token is indeed what I wrote, it appears the strtok() needs
>more than one '\0' to stop and you're just lucky to have an extra one after
>the string. That would of course make the strtok() quite buggy!

That appears to be the case. I've just had the time to experiment with
the following ...

#include <string.h>

main()
{char *s[2],

```
*p;

s[0] = " line1 | line2 ][ Ok | Cancel ]@";
s[1] = strchr(s[0],']');
*s[1]++ = NUL;
printf("s0={%s}, s1={%s}\n",s[0],s[1]);

*strchr(s[1],'@') = NUL;

p = strtok(s[0],"|");
while (p) {
puts(p);
p = strtok(NULL,"|");
}

p = strtok(s[1],"|");
while (p) {
puts(p);
p = strtok(NULL,"|");
}
}
```

.. which produces the expected results. If I take out the hack for the trailing '@' then it produces this ...

```
s0={ line1 | line2 }, s1={[ Ok | Cancel ]}
line1
line2
[ Ok
Cancel ]
s0={%s}, s1={%s}

[ Ok
Cancel ]
s0={%s}, s1={%s}
```

.. and it just so happens that MWC is storing the printf() format string directly after the alert string.

My original code needed to leave the alert string intact thus I was using strdup() - naturally there was less chance of there being two nuls in dynamic space than in the static space used in the above test program.

So, MWC strtok() _is_ knackered!!!

> BTW, the symbol table and/or debug info is not loaded into RAM by
> the system.

Oh. My error.

I just thought that all of the executable file was loaded at app start.

After all, all the code and data segments of the app are loaded during app start, and the bss space appears at the end of the data space in RAM.

Therefore it'd be logical (given the "load everything" philosophy GEMDOS seems to adhere to) to also load symbol and debug info at start time, prior to fixup and passing control to the app.

> I suspect that the OS doesn't ever look at the basepage once the
> program is loaded. It is simply used during the loading process and
> as a one-way information transfer.

However, if I was writing a multi-tasking OS, I'd use the "reserved" portions of the basepage for internal info used during task switch (the apps priority, last time it was given CPU time), and during shutdown (such as pointers to an internal [to the OS] table with a list of Malloc blocks used by the app, and so forth). Therefore, I would (as an app writer) leave the basepage alone - otherwise the OS may vomit over the rest of the system when it hits unknown data placed there by the app.

However, the command-line portion of the basepage seems to be fair game. It gives room for sixteen (128/8) cookies. And with the DTA overlaying the command-line area, I'm a bit more paranoid about setting it to somewhere else before using any of the directory enumeration funcs (Fsfirst and Fsnext spring to mind)

>pushing it. Heck, you might even get a monitor with it for an extra
>$25 or so.

Sure, go buy an Amiga from someone else - we will still help
you install the software on it. Since we only have one Amiga and four
Howard boards, people will have to get the other Amigas from somebody else.
It does sound like a good place to buy monitors too. But if you bothered
to read in the correct context, we aren't selling the Amiga as a stand-alone
system. Only as part of a package. For the person who wants a pre-installed
system (which looking at PC sales, there are lots of them), it makes sense
to offer one. And PC retailers do charge extra to install software and
make sure everything works together. We also checked with a local Amiga
dealer and he was selling Amiga 2000's for $400 each.

>(4. Units are ... sold "AS-IS".

>An "AS-IS" 2 grand investment? You'd have to be a fool to take one
>up on something like that.

And the people in comp.sys.amiga.marketplace are offering warranties on
their products? Ever buy a car from a used car dealer? The last one I
bought was for $7000 and had AS-IS marked on the sticker. What that
means in the US is that it has no express warranty. The buyer accepts

the fact that it might have some scratches and been used before. These units have been tested and do work. What does AS-IS mean in Canada?

> ///\ Thomas Clancy

the opinions expressed here are my own
the facts (claims) expressed here are true, not false

(I wonder why people in England and Canada have a hard time with people getting paid for an honest days work? Could it be their knowledge of American English and culture is lacking? Or are their morals really that different?)

(What is the false claim? Is there anyone in comp.sys.amiga.marketplace

They make it sound as if they are doing you a favour by over-charging
for an ancient machine. They said (basically) that you wouldn't find
it anywhere is for less (false). They might be offering a deal on the
lynx-only stuff... but they're taking you to thte cleaners on the
A2000 setup.

(selling Lynx development systems? Haven't you ever heard of value-added
(retailers in Canada?

Value-added? Bah! I call it taking advantage of those that don't know
any better. He he not claimed that a lower price could not be found,
I would not have posted the info.

(>They sure will. That 2k w/5MB 51MBHD an WB1.3 can be had in
(>comp.sys.amiga.marketplace for nomore than $175.00 and even that's
(>pushing it. Heck, you might even get a monitor with it for an extra
(>$25 or so.

(It does sound like a good place to buy monitors too. But if you bothered
(to read in the correct context, we aren't selling the Amiga as a stand-alone

Context? Go reread what you posted.

(system. Only as part of a package. For the person who wants a pre-installed

Yes, and you made it sound that since (and only if you're buying this
package) we'll throw in this dandy system for this real-good price.

(make sure everything works together. We also checked with a local Amiga
(dealer and he was selling Amiga 2000's for $400 each.

Because you neighbour robs banks doesn't justify the fact that you do
to. If you can't compete with the market, then pehaps you shouldn't
be in it.

(>(4. Units are ... sold "AS-IS".

(>An "AS-IS" 2 grand investment? You'd have to be a fool to take one
(>up on something like that.

(And the people in comp.sys.amiga.marketplace are offering warranties on
(their products?

Almost 100% of the people there offer DOA guarantees, alot offer 30 days
etc.. You'll never see gear valued at over $75 sold as-is (rarely).

(Ever buy a car from a used car dealer? The last one I
(bought was for $7000 and had AS-IS marked on the sticker.

Then you're crazy.

(What does AS-IS mean in Canada?

In my province, it means nothing. It means that if there was an
existing defect that the consumer wasn't warned about, then the
dealer is still responsible. Aside from that, according to law here,
you've 30 days (or was it 10) to cancel. That aside, practically
all used car dealers here offer 90 day warrantys =')

((I wonder why people in England and Canada have a hard time with people
(getting paid for an honest days work? Could it be their knowledge of
(American English and culture is lacking? Or are their morals really that
(different?)

Getting paid? Who has trouble getting paid? Hell, your country is the
one that doesn't seem to have the bucks to help th unfortunate (welfare).
I doubt there is such a thing as "american" culture (in the true sense
of the word). Morals seem to be different? - I'd say yes. Perhaps that's why
americans rank the highest in the world of "least liked" - the vocal few
that come off as egomaniacal/self-centered/the world should follow us
attitude.

As an aside, what does getting paid in Canada have to do with lack-of
knowledge of American "culture" and American english (if such a thing
exists)- is this yet another example of ego? I would have referred to
it as "New World" english (as does Webster's "New World" dictionary.

Wow, what digression... from lynx packages to culture... to getting
paid... to automobile warranties... morals. =')

K,

(1) What are the advantages of putting the guts of the program in DLLs
and putting the RC files in the EXE.. Or the other way around..
Or better said.. When designing a system what criteria is used to make a
decision about what goes into a DLL & why?

(2) We have a prototype of the program in VB4 16 bit.. We would like to
use this as a front end and use VC 1.52 as the back end.. What is the
best way to do this or is it easier to just do the whole thing over in VC..

This is a 16 bit app only!

(3) What are the considerations regarding DLL & OOD?

(4) Does VB auto unload DLL's when done useing the function?

4447. Dlock() prevents Fsfirst()/Fsnext() from working correctly?

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-14 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <1e7cd$12e2d.190@HERMES>
Source record: 7645

As part of a filename validation app that I wrote to supplement the CD-writer software Brian & Mario Becroft <mbecroft@tos.ak.planet.gen.nz> use when creating CDs (which has a very tedious "you have to exit the app to change/correct a failed filename" problem), I have run up against a problem when making my app (which searches and validates filenames against some simple rules, and then allows the user to correct any "failed" filenames) a bit more MiNT friendly.

Whilst my app runs OK without fouling itself or the disc it is checking, when I use Dlock() prior to enumerating the directory structure with Fsfirst and Fsnext, the search reports "zero files" searched on the disc, even though there are ~2000 files on the drive. Removing the Dlock call gets the correct results.

Changing the search to any other drive (such as my old Megafile 60, which has not really been used for aeons, and had no active ["open" or "in use"] files on it at search time) also gives the same failure.

(I am using Freemint 1.14, Memory-Protection 'on' and AES 4.1, on a 20 Mbyte RAM TT. I have just under 1 meg of ST RAM and about 8-10 megs of TT ram free at app run time. The app was flagged to Load and Malloc from TT ram. Switching protection off produced the same [bad] result).

It operates exclusively in the TOS domain, on GEMDOS 8+3 filenames.

Here is roughly what my source looks like (in Lattice C 5.60) (configured as intsize = 32-bit, target CPU = '030). I've snipped the surrounding GUI code, and the code that sets the basepath to be searched, and I assume you are all prescient enough to know what I mean by my redefined data types like "uint32".

The search code will recursive search any directory it finds in the search path, even though the source I present here doesn't show this. (I've set my stack to something like 64k, even though the worst case I've seen it only needs something around 48k or thereabouts [each recursion uses about 800 bytes of stack space])

```
-- BEGIN Source Code Snippet --

typedef enum { ... } Reason;

extern uchar8 basepath[255+1];

XATTR xattr;
uint32 mintcookie;
uint32 err;
uint16 count, failcount;
```

```
struct FILEINFO finfo;

mintcookie = 0;
if( getcookie( 'MiNT', &mintcookie ) && mintcookie > min_version_ver ) {
Fxattr( 0, basepath, &xattr );
Dlock( LOCK, xattr.dev );
}

count = 0;
failcount = 0;
err = Fsfirst( "*.*", 0x3f );
while( !err ) {
Reason reason;

count++;
if( !validate( finfo.name, &reason ) ) {
fail( finfo, reason );
failcount++;
}
err = Fsnext();
}

sprintf( alert, "[1][%d files searched|%hd failures][ ok ]", count, failcount );

if( mintcookie > min_mint_ver )
Dlock( UNLOCK, xattr.dev );

Hi!

Does anybody know where I can find information on the new/extended AES-calls in AES 4.0/4.1? And are there any free libraries for Pure C (I have 1.1) that supports these? Maybe my current libraries has 4.0/4.1 support, it supports appl_search() although it's not mentioned in the helpfiles.

Yeah, but it's a lot easier finding someone to repair a broken car... ;-)

> is good for Gem applications, though you can write games but they would
> not be arcade fast. Yet you can get away with games that just wait for
> your mouse click and look good in a window. :)

C is good for GEM aplications true, but it does as easy non GEM games, giving you all the speed and power you need. I am getting the idea you think C is only good for GEM, and that's wrong. C is good for almost everthing, fast arcade games, GEM applications and packers.

> If you're real good at assembly to write a game competely in it, go
> for it! It would be much faster and better if you know how to squeeze
> it out of the system. :)

Knowing how to squeeze the maximum speed out your system is the most important part. Use the wrong technique and even the fastes assembly implementation will make your game fast.

However a high level language around an assembly game is nice. Doing disk acces and memory management is assembly is a hard task and won't bring much speed improvement. I usually write the routines first in C and convert the most time consuming routines into assembley.

I have to say that the price you want for these units is very steep.
They may have cost $5000 originally, but it wasn't that long ago that
286's cost that sort of money, and you can't even give them away now.
It's an unfortunate fact that computer equipment devalues hideously
quickly, and obsolete equipment is worth almost nothing. The units you
are selling aren't even new. Half price may be reasonable for
second-hand units for a CURRENT product, but the LYNX is effectively
dead. No more are being made. Atari in effect no longer exists. There is
therefore no hope of marketing or advertising support for any new Lynx
related product. Also, what if the thing breaks down? They are full of
custom chips. What hope of getting spares? This is a very risky
investment!

$2000 may not be much to a professional developer, but how many
professional developers are really going to be interested in the Lynx?
Can you HONESTLY make a livable income writing Lynx games?

In my opinion, the only people who are likely to be interested in the
development units are tinkerers, like myself. I would be very interested
in obtaining a development system, but not at this price. The price
would have to be about a quarter of what you are asking for me to
consider it. If you find you can't sell the units, and are prepared to

drop the price, then contact me.

My offer isn't going to get any higher...Sorry.

Lionel...

Lionel Theunissen <lionelth@ozemail.com.au> mumbled indistinctly:

>> All this can be had for only $2000 + shipping each. You won't find a
>> better offer anywhere in the world! Atari charged developers $5000 for
>> these units but you get one for less than 1/2 the price.

A comparison is in order here:

A third party Jaguar dev kit is approx 300.00 (uk).

An SNES third party dev kit is around 350.00 (uk).

The Sony Yaroze Playstation home dev kit is 550.00 (uk), and includes
rather a lot of stuff for the money - assembler, C compiler, debugger,

developer PSX, libraries, documentation, free Pipex account, 3d
object creators, graphics convertors, loads of utils, etc. Available
direct from Sony only.

I could quote retail on a full-blown pro Playstation dev kit, but my
licensing agreement with Sony prohibits it - all I can say is that
it's a bit more than that ;)

Datel were selling a system that would stand in for a full blown
dev kit for around the 200.00 (uk) mark.

I can say what 3rd party pro-dev kits for a Saturn cost, and it's
around the 5000.00 (uk) price by the time you've bought everything
you need.

I think, on reflection that the $2000 for a Lynx dev kit with no real
probability of a market for product from it is a bit steep.....

I've got a Vectrex dev system that I put together myself
- bet there's even less of a market for that, but I know of at least
three new games that have been released just recently. Fact is
that folks only do old platforms for fun and nostalgia now, and
$2000 is just to much (I used a Crash Barrier EPROM emulator
and a dismantled cartridge to build the Vectrex dev unit in case
anyone is interested - just to prove to a guy in the office that
it could be done).

Much better call is for folks to sign up to the Yaroze project
on Sony - it's cheaper, you get more for your wedge and
you get a crack at the wider world if you produce something
worthwhile (license it to a big boy like Psygnosis). Or do it
for a better reason - fun, and a chance to face off against

the best of the amatuar game dev fraternity from Japan &
Europe.
UK delivery of Yaroze kits is february, US launch should be
some time after that - we finally get something first ;)

Which comes first, getting the facilities to produce, package, and
market a game? or selling it?

We have hundreds of EPROM cards in stock waiting for the software to be
done. We have dealers who are ready to distribute anything we write.
We are working on getting boxes and manuals made that look like the
ones that Atari did (as opposed to what Telegames is doing). We have
the EPROM programmer and EPROMs (and I'm ordering more EPROMs today).
The only thing we don't have is a "track record", but I don't need one
to offer these services.
For example, if Carl Forhan wants us to make 200 Pong games
and sell them, we could get it done in short order.

If anyone buys a Howard board from us, writes any kind of
game, and needs facilities to sell their game, we have it.

repeat sales pitch

Only $2000 buys you a Lynx business opportunity - not a toy or a
collector's item. Call (612) 462-2500 to order one.

****
Watch this space for new Lynx games currently in development by
Carl Forhan, Bastian Schick, and myself.
This is NOT a vaporware announcement.

Wrong, <20USD !

Tell me, does one of these dev.kits provide real debugging ??
With a Howard board, you have a Lynx where you can access nearly every
single register.
I think the N64 dev. kit is the only one giving you this feeling.

>gets the correct results.

I've never used Dlock(), but I did once have problems with Fsfirst() and Fsnext(). It turned out that a call to the file selector in early TOS versions was changing the DTA on me. I fixed the problem by inserting an Fsetdta() immediately before the Fsfirst(). (And in the words of the Atari Compendium, "Be careful to avoid assigning your DTA to a local or automatic variable without setting it to its original value before the variable goes out of scope.")

I don't know if this will work, but the problem you describe sounds very similar to mine - my application kept trying to open null file names.

>AES-calls in AES 4.0/4.1?

Well, if you are looking for books, the Atari Compendium has info on
all the AES 4/4.1 calls. Alternatively, Modern Atari System Software
contains info on AES 4.0 calls.

If you want WWW pages, well I have some information on ToolBars on
my WWW pages, but I haven't done docs for all functions...

>And are there any free libraries for Pure C (I
>have 1.1) that supports these? Maybe my current libraries has 4.0/4.1
>support, it supports appl_search() although it's not mentioned in the
>helpfiles.

No idea - I dont use Pure C, but the Lattice libraries have 4.1 support.

Hi!

In article <1e7cd$12e2d.190@hermes>,
gmiller@inca.co.nz (Gaven Miller) writes:
> Whilst my app runs OK without fouling itself or the disc it is checking,
> when I use Dlock() prior to enumerating the directory structure with
> Fsfirst and Fsnext, the search reports "zero files" searched on the disc,
> even though there are ~2000 files on the drive. Removing the Dlock call
> gets the correct results.
Sure. Haven't you read the Dlock()-manpage? The first paragraph should clear
things up:

-- snip --
Dlock is used to lock or unlock the BIOS device indicated
by drv. No GEMDOS file operations are permitted on a
^^
locked drive. Thus, the Dlock call provides a mechanism
for disk formatters or re-organizers to lock out other
processes while low-level BIOS or XBIOS operations are in
progress on the device.
-- snap --

Dlock()'s main purpose is - as described above - to allow low level tools to
directly change the structure of a filesystem. If it would still allow
GEMDOS access to the locked drive (even by the caller), this could easily
cause a big mess, e.g. if a new file would be written during a defragmentation
process. Dlock() also makes sure that no process has open files on the drive
you wish to lock, because this could also leed to serious problems.

Another purpose of Dlock() is forcing a media change, which automatically
happens when the drive is unlocked, because the contents could then be
completely different.

So, don't use Dlock() if you don't plan to manipulate the physical data
structure or need a media change to be forced for some reason. If you want
to make your app more MiNT friendly, as you've written, better let it run in
the MiNT-domain and use Dpathconf(), Dopendir(), Dreaddir() and Dclosedir()
to count the files instead of the obsolete Fsfirst()/Fsnext()-combination.

And btw, don't check the MiNT-cookie if you want to use new GEMDOS calls
like Fxattr() and Dlock(). Simply call them; if they do _not_ return -32L
(EINVFN), you can use them. Otherwise, they're not available. This is
important if you want your program to be able to use the enhanced GEMDOS
calls with MagiC as well. Even some MetaDOS drivers offer Dopendir() & Co.
without the need for MiNT!

Hope that helps ...

Ciao

> prior to fixup and passing control to the app.
As far as I know, the OS really loads the complete binary into the RAM, but
that's not a problem at all. The position and sizes of TEXT, DATA and BSS are
set according to the program header, and when the BSS size is greater than
zero, the BSS gets zeroed, thus overwriting (parts of) the symbol table in
RAM (or the debug info), if the loaded program had one.

The screenmanager of MagiC supports some undocumented messages you can send
to it via appl_write(), and two of them are used to hide and unhide
applications. Another one activates the menu bar of a running application.
I could look up details, if you want.

Hello,
I am Michel Bieleveld and I have a big problem, at least it is for me.
I want to know how I can address Paddles for the Atari 800 XE and I want
to know wich electronic parts are used in it. I'm verry desperate
waiting for you're answer.

My e-mail adress is M.Bieleveld@pi.net

Greeting from me !

4481. WMF 2 GEM/ and/or CVG 1.1 needed

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-21 00:00:00 UTC
From: Ramiro Tellez Sanz <rtellez@filabres.ualm.es>
Message-ID: <Pine.A32.3.91.970121212113.35864D-100000@filabres.ualm.es>
Source record: 7678

Hi everybody!

I have an idea to any programmer out there.
I desperately need an utility to convert *color* WMF files from PC's
(aargh) to GEM/3 and/or CVG 1.1 (both in color, of course).
Once converted, the file should be intact (i.e, no difference at all with
the original WMF).

This program could be shareware. I'd register it as soon as it was
developed. Anyone interested?

Of course, if such an application already exits, please tell me, also if
this option is included into any other program not only dedicated to this
task.

Thanx

Name: mimelite
Product: library
Platform: ANSI C
Where:
ftp://oslonett.no/Software/MsDos/Kommunikasjon/Offline/mimelt20.zip
Author: Gisle Hannemyr <gisle@oslonett.no>
Comments:

[Gisle Hannemyr <gisle@oslonett.no> 20-May-1994]

"mimelite" is a simple, lightweight library written in ANSI C that supports the parsing of MIME headers and encoding/decoding of body parts, suitable for inclusion in offline-readers.

If you develop mail and newsreader software (user agents), you can link mimelite with your own program to make it support a significant subset of MIME (namely the Content-Transfer-Encodings 7BIT, 8BIT, BASE64 and QUOTED-PRINTABLE). mimelite also supports conversion between the ISO Latin 1 character set used for European character sets on USENET/Internet and PC-based character sets (e.g. Macintosh, IBM CP-437 and CP-850).

The distribution archive also contains UNMIME, a standalone program to decode MIMEd messages encoded with BASE64 or QUOTED-PRINTABLE encoding.

The mimelite library is general enough to work in a number of contexts, but it has been designed to work well on MS-DOS (where memory is a scarce resource). Its main application is intended to help extend MS-DOS-based "offline-readers" for RFC-822 and RFC-1036 conformant messages to also support RFC-1521 and RFC-1522.

From comp.mail.mime_FAQ,_part_2_of_3 :

Author: John Gardiner Myers, Chris Newman (Mac), Mike Meyer (Amiga),
Peter Simons (Amiga), Jochen Friedrich (OS/2),
Olly Betts (Archimedes)
Comments:

[John Gardiner Myers <jgm+@cmu.edu> 16-Feb-1995]

Mpack is a minimal implementation of MIME, designed for encoding
and
decoding binary files in MIME messages. In short, it is the MIME
equivalent of uuencode and uudecode. For backwards compatibility,
it can also decode messages in split-uuencoded format. The
Macintosh
port can also handle AppleSingle, AppleDouble, and BinHex.

Starting with version 1.5, all official mpack distributions are
PGP signed by "John Gardiner Myers <jgm+@cmu.edu>". The PGP
signatures are detached from the distributions themselves, in
files with the ".asc" filename extension.

[Arjan van der Meer <arjanvdm@htsa.hva.nl> 30-Jan-1995]

There is now a version of mpack/munpack for the Atari ST and
compatibles. It is just a compiled version of the UNIX 1.2 version,
but what I've tried worked okay. It is made by
alex@hal.rhein-main.de.

4485. Re: COMPLETE Atari Lynx Development systems for sale

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-21 00:00:00 UTC
From: rochelle@umcc.umcc.umich.edu
Message-ID: <rochelle.853846524@umcc.umcc.umich.edu>
Source record: 7682
Cross-posted to: alt.games.lynx,rec.games.video.atari,comp.sys.atari.8bit,comp.sys.atari.programmer

IMPORTANT NEWS

Due to someone (you know who you are) whining to JTS about the
Howard boards sales, there followed a tense conversation between
John Scruch of JTS and Lance Rinquist of Video 61. The result
is that I have to publicly add these extra conditions/disclaimers
to our sale of Lynx development systems:

1. JTS does NOT support these systems in regards to hardware
2. JTS does NOT support the software for these systems
3. JTS will NOT provide technical support for Lynx game development
4. JTS has specified that we can sell these systems only under these
terms: "AS-IS" and as "Collector's Items"

Simple translation: Don't bother John Scruch anymore. They sold
these units to us and they don't want to hear anything else about them.

So if you want to buy a very special Lynx collector's item, call
(612) 462-2500. The price is still $2000 each. Each one has a
serial number on the bottom and from the ones we have, there were
probably 200 of these units built at most.

Harry Dodgson
2600/7800/Lynx developer

I personally would think all those conditions were 'givens'. I doubt
that
JTS is willing to support ANYTHING developed or sold by Atari unless
they were required to by law.

No, GEMDOS only loads the Text, Data, and Relocation segments of a file.
The Symbol segment is never read. You can verify this by watching the
Rwabs() calls that happen during Pexec().

Not free, but Geneva includes a NEW_GEM.LIB for Pure C.

j > Maybe my current libraries has 4.0/4.1 support, it supports
j > appl_search() although it's not mentioned in the helpfiles.

It is in the English version; at least, whatever is in AES.H is
documented in the help files. What's missing are mostly new window
features and object flags, which are only macros.

appl_getinfo(AES_WINDOW, &wf, &unused, &gadgets, &unused);
if(gadgets & 1) { /* iconify supported */

Of course, you might want to check if appl_getinfo() is supported
first.

g > However, if I was writing a multi-tasking OS...

Autorun programs on a version of TOS which doesn't support cookie jars do not multi-task. Geneva REQUIRES JARxxx.prg (I don't know what MagiC does for it's cookie jar).

The one I gave the source code for has only one good feature: it doesn't take up much RAM.

>
> (4) Does VB auto unload DLL's when done using the function?

These really aren't appropriate questions for cross-posting to most of
the
comp.sys groups that they were sent to (the obvious exception being the
PC
one).

However, I can answer some of the questions you ask:

1. You should really try hard not to use DLLs unless you:

a) are running several separate programs that share common
functionality provided by the DLLs

b) are using a DLL to "inject" into another program's memory
space under Win95

or c) have large portions of code in your application which are
hardly ever used (they should preferably be reusable as well).

This way, your program doesn't slow down unnecessarily by using DLL
calls all the time, and doesn't force the system to keep loading and
unloading unnecessary DLLs. Some programmers have a tendency to go
way over the top in this area.

2. This is another possible reason for using a DLL. VB will not link
with
C code, so you must place C subroutines in a DLL to allow the VB
program
to call it. And yes, this is the way to use C compilers as a back end

to a VB program. It would be better to re-write if you have time.

3. You'll have to be more specific here.

4. I suspect that it does; I'm not really all that sure - certainly, when
using the IDE, it unloads DLLs when it stops running the program. This
would tend to indicate that they are dynamically loaded, in which case
it's up to Windows whether they remain around or get unloaded.

appl_tinfo or some such function. [I cannot remember exactly how
right now...]

However, why do you need to check to see if it supports iconify?
All AES versions will just ignore the SMALLER gadget if it doesn't
support it. (ie. wind_create(SMALLER | TITLE...) will just not create
the gadget, and you will never get a WM_ICONIFY message on older
AES versions).

Only of interest to UK users...

People doing bulk snailmail posting in the UK can get discounts from Royal Mail by presorting the mail to their spec and producing some reports. This service is called Mailsort; for more information, get in touch with your local Royal Mail sorting office.

Doing the sort and generating the reports yourself is much aggravation, and is best left to a computer. Enter Mailshooter, an application which reprocesses and sorts comma-separated-ascii mailmerge data and does all the other stuff too. It even calculates your costs and discounts.

The package has passed Royal Mail tests for correct production of results.

Requires 1MB+ memory, plus hard drive; on my STe it handles about 1000 records per minute. It can handle a data file bigger than available system memory, but will go slower.

Look for "mshoot11.zip" on 42BBS [+44 (0)1256 895106] .

It's shareware; fifty quid; the distribution is fully functional but unless you register you don't get the tool which takes the pain from installing Royal Mail's Mailsort database.

Er, what makes it worthless? I use it quite a bit, especially with
CAB. It's great to iconify CAB while it's downloading a slow web
page. It allows you to do other things....

Yeah, but my program needs to be able to iconify. And I want to be able to check if the OS can do it, and if it can't, use the fuller button as an iconify button (with some iconify routines, ofcourse).

What makes it worthless is that you can only iconify if the user
clicks the SMALLER. There is no way to actively iconify a window.
Also, many applications don't support iconify all, so if someone
control + clicks on the smaller a slot gets reserved, but no
icon appears. The slot will be empty until you reboot.

Truly one of the worst protocols I've ever seen.

4503. HELP! GCC to Lattice C conversion

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-24 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <5cb1qn$oem@madeline.INS.CWRU.Edu>
Source record: 7552

Can someone help me? I am trying to convert a program written for GCC to
Lattice C. I had it running before, with the help ofthe minltibs for
Lattice C from Hensa, but fouled up my disk directories, and lost the lib
changes I had made. The problem is rather trivial, I am afraid, but
beyond my C state at the moment. The program used __aline
and __FONT, which are in the GCC and mint libs,but notin Lattice.
__aline is something like li_d0 and __FONT is now LA_FONT.
But I don't know enough yet about structures to get it towork.
If someone can help,who knows GCC and Lattice, I could send the one
short routine (about 100 lines with 2or 3 lines to fix) to show me how
to fix it.
HELP?????

You don't necessarily need to know, just program iconification into the
program (window parts list must include SMALLER and react to any WM_ICONIFY
messages in your evnt_multi.

>What is the best way to check if an AES supports iconification?

No need to bother. Just implement support for the messages. After all,
you won't get them if they aren't supported.

There is an alternative iconification server which is more powerful
and pretty easy to implement. It comes as an auto folder program and a
cookie called 'ICFS' iirc and thus can work on any system. It is
available for download somewhere but I've lost those details.
Hopefully I've said enough for someone else to know what I'm on about
and fill in the gaps. ;-)

4507. Recovering from Bus errors

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-25 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <11a7cd$134c.28f@HERMES>
Source record: 7556

As part of my Toolbox TSR, I'm trying to determine the exact amount of RAM a machine has installed - so the tlbxMachine call I've implemented will report the correct amounts of RAM installed.

The documented system variables _phystop (addr $42e) and _ramtop (addr $5a4) are supposed to give the address of the first "unaccessible" byte beyond the end of installed physical RAM.

However, as some software (for example Hisofts reset-proof Ramdisc) lowers _phystop, I have been trying to write a piece of code which validates the values stored in those two system variables.

All goes well until the code hits the RTE at the end of my bus error handler, and then the whole machine hangs - no bombs, nothing. Only a press of the reset button (or keyboard reset) will cure it.

The bus-error code runs in supervisor mode, and all it does is alter the return address from the exception to point to known "good" code, and, when running on a 68010 or better CPU, clears the "Retry Failing Access" flag in the stack frame (bit 15 of the word at offset 8 for an 010, or 10 for an 020/030) - which is not necessary on a 68000 as it cannot retry a failed instruction.

Disabling the ram test does not hang the computer [a 20Mbyte TT (4+16), TOS 3.05, not-overclocked 68030/68882]

By the time this code runs, the following stuff has run:
AHDI 6.06 (to boot the SCSI HDD)
and then from the AUTO folder
TT2STHI (puts TT into ST High rez from ST Low in which it boots)
unclick (switch keyclick off)
Hramdisk (Hisoft resetproof ramdisc)
foldr999 (extend folder count)
amon030 (68030 autoresident debugger [from Devpac 3.1])
xboot (boot manager)
maccel (mouse accelerator)
fpufix (corrects _FPU cookie to show real FPU)
And then my TSR runs.

Here is what my code looks like: (In Devpac 3.1)

(Lifted directly from the source. I've just now added comments, however)

(BTW: removing the "illegal" instruction at the start of this code [which is used so that I can single-step through it using the AMON auto-resident debugger] does not alter the problem - it still hangs)

```
in the main body of the code, whilst in the CPU's Supervisor mode it is
called with:

4508. System call interfaces

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-25 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <11a7cd$312c.1ee@HERMES>
Source record: 7557

What is the best way to implement a system-call interface?

Should it be like the GEMDOS/BIOS/XBIOS and have all params passed on the system stack?

Or via a parameter block which must be filled in by the app with appropriate info prior to the OS call? (like GEM AES/VDI requires)

Or is there a better way?

I have been looking at my Toolbox TSR, and wondering if I should upgrade the application-to-Toolbox call interface. (I do this every year or so, trying to smooth the interface, prevent any bugs and so forth)

At present it is structured in much the same way as the GEMDOS/BIOS/XBIOS with a function code on the stack, and (function specific) params following it further on in the stack.

For example, a call to it to get info about the installed CPUs in the computer is as follows: (function "tlbxProcessor")

```
pea buffer ; buffer to be filled in
pea $430.w ; function code
moveq #0,d0 ; API - reserved (must be zero)
moveq #$10,d1 ; API - magic number (must be $10)
move.l d0,a0 ; API - resvd (must be zero)
move.l d0,a1 ; API - resvd (must be zero)
trap #0 ; call the Toolbox
addq.w #4+4,sp ; fix the stack
```

with buffer being (currently) defined as a 12 (or is it 16?) byte buffer in memory, which will be filled in during the trap call.

Now, if I changed the interface to be like the GEM AES/VDI interface, then it would become something like:

```
lea buffer,a0 ; buffer to be filled in
move.l a0,tptrs+0 ; put it in a pointer array
move.l #$430,tcontrol+0 ; function num to control array
moveq #0,d0 ; API - must be zero
moveq #$11,d1 ; API magic (must be zero)
move.l d0,a0 ; API - must be zero
lea tglobal,a1 ; API pointer to parameter block
trap #0 ; call the Toolbox
...
```

with tglobal being set up like:

```
tglobal:
dc.l tcontrol ; control struct (func numbers, ap ids etc)
dc.l twords ; 16 or 32-bit integers
dc.l tsizes ; sizes of items
dc.l tpointers ; pointers
dc.l tfloats ; floating point values
```

and then each of tcontrol, twords etc would need to be defined and allocated memory space for the largest possible requirement, irrespective of whether the task at hand actually needs that much or not.

As far as I can see, there would theoretically be less stack usage with the second form, but potentially a larger memory footprint due to the globally allocated arrays being possibly larrger than needed.

And the second form would be slower to handle, as one would need to indirect through the parameter block to get at the data, whereas the first way has the data on the stack ready, and one merely has to pluck it straight from RAM without an indirection slowdown. (This indirection is less of a hassle on 020 and better CPUs, but it is still slower than just plucking data from the stack directly)

Is there a specific reason that the GEM AES/VDI call interface was implemented differently to the GEMODS/BIOS/XBIOS call interface?

And, is there a better call-level interface that could be implemented?

I'm not sure I understand the issue. Are you saying there's no way
for an application to iconify itself? What do you mean by "actively
iconify a window"?

>Also, many applications don't support iconify all, so if someone
>control + clicks on the smaller a slot gets reserved, but no

Don't you just normally click (not control-click) on the smaller button
(the button to the left of the "maximize" button)?
And besides, the smaller button doesn't normally appear on applications
that don't support the iconifcation, right? I've never seen it on, say,
my Prospero C editor. But I do agree that it would be nice if you could
iconify applications that don't explicity handle iconification.

Final Notice: IEEE's COMPCON 97 Set for Feb. 23-27 in San Jose

Visit the COMPCON 97 World Wide Web page for more information and/or to
register:
URL: http://www.compcon.org

or read the following :)

SAN JOSE, Calif., -- One of the country's pre-eminent computer
technology conferences -- Compcon 97 -- will be held
February 23-26, 1997 here in the heart of the Silicon Valley.
This continues a tradition of more than 40 successful years in the San
Francisco Bay Area for this non-profit technical conference.

"Hot Systems/Cool Software" is the theme of COMPCON 97, underscoring
the importance of new computing technologies and applications in both
the computer industry and society.

"Computer technologies ranging from world-record 600MHz processors to
eye-catching Java applets and VRML virtual worlds will all be featured
at COMPCON 97," said Darrell Long, the conference chair and computer
science professor at University of California-Santa Cruz. "COMPCON
has the reputation as a one-stop, no-hype overview of the important
developments in our industry. If you could only attend one technical
conference a year to learn about the overall state of the industry,
COMPCON would be your choice."

Adds Dr. Joel Birnbaum, Vice President, R&D and Director of HP Labs:
"COMPCON has been consistently a valuable conference presenting a
broad technical program on state-of-the-art computing technologies."

IEEE COMPCON 97 will be held at the San Jose Hilton
and Towers Hotel (300 Almaden Blvd.) in downtown San Jose, Calif.

COMPCON is sponsored by the Institute for Electrical and Electronics
Engineers (IEEE), a non-profit professional association, and has been
held in the Bay Area annually since 1955.

Its 27 technical sessions and six in-depth tutorial topics run the
gamut from the design of advanced central processing units and
networks to computer systems, advanced programming and world wide web
technologies. In addition, five well-known industry luminaries will

give plenary talks. COMPCON has no marketing presentations or product exhibitions.

COMPCON 97 program overview:

INTERNET/INTRANET TECHNOLOGY: Trends, Environments, Applications

SYSTEMS: Superservers, Mobility, Software Architecture

MICROPROCESSORS: High-Performance, Low-Power

INTERCONNECTS: Parallel Computers, LAN and WAN, Wireless

VIDEO: Advanced Displays, Digital

MULTIMEDIA: Technologies, Software Environments, Applications

PARALLEL/DISTRIBUTED SYSTEMS: Applications, Hardware, Compilers

OPERATING SYSTEMS: Object-Oriented, Microkernels

PERIPHERALS: Mass Storage, DVDs, Display Technologies

EMERGING TECHNOLOGIES: GigaHertz Devices, Advanced Hardware, Java

Tutorial topics include: 3-D graphics, virtual reality, web site design and security, advances in computer architecture.

Plenary speakers include:

Federico Faggin (Synaptics) -- "The Microprocessor: Its History and Future"

Hector Garcia-Molina (Stanford) -- "Meta-Searching Across the Internet"

David K. Gifford (MIT and OpenMarket) -- "The Future of Electronic Commerce"

Ted Laliotis (Laliotis and Associates) -- "To Tax or Not to Tax Internet Transactions"

Dave Nagel, AT&T

Advance reservations to Compcon 97 can be made through the web site or by contacting:

Please don't keep posting replies to this message to inappropriate
newsgroups. (see your header). It should really only go to groups
that are interested in PC programming, and not any of the following:

comp.sys.acorn.programmer
comp.sys.amiga.programmer
comp.sys.atari.programmer
comp.sys.apple2.programmer

I'm a little dubious about some of the other groups in the list also.

That's a bit unfair. It's iconification support is OK... even
under bloatware like Windows, iconification is handled largely
by the program in question.

The best way is to use appl_getinfo(). This function exists if
you find that appl_find("?HAGI") (I think) returns something
other than a failure code (which I guess must be negative).

A much better way to recover from the bus error in such a routine is to
save the SP before running the test and to restore it in the bus error
handler before directly jumping back to continue with normal work. No
need to muck around with the exception frame, instead just throw it away.

```
Hi,

I'm trying to make contact with the SCSI-port
on my Falcon. This little program bombs out
with two bombs, why?
I'm using the data-adress that the Profibuch
tells about the TT.

I have used Lattice C ver 5.something.

//scsi.c
//To make contact with the scsi-port
#include <stdio.h>

unsigned char GetData()
{
char string[64];

printf("Please input 8-bit value (0-255): ");
gets(string);
return((unsigned char)atoi(string));
}

void WriteData(unsigned char val)
{
//I have tried 0xff8781 with the same result
unsigned char *data=(unsigned char *)0xffff8781;
*data=val;
}

unsigned char ReadData(void)
{
unsigned char *data=(unsigned char *)0xffff8781;
return(*data);
}

void ShowData()
{
printf("Value in scsi-data: %d.\n",ReadData());
}

void main()
{
long super=gemdos(32,0L);

if (gemdos(32,1)!=-1) {
printf("Not in Supervisormode.\n");
```

```
return;
}

ShowData();
WriteData(GetData());
ShowData();

gemdos(32,super);
}
```

4521. Re: Recovering from Bus errors

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-27 00:00:00 UTC
From: Jesús Cea Avión <jcea@argo.es>
Message-ID: <32EC861B.B7F@argo.es>
Source record: 7570

I think the easiest option is the following:

a) Go into supervisor mode
b) Save stack pointer
c) Save Bus error pointer
d) Change the bus error pointer to your "x" (explained later)
e) Make your memory check
f) Restore bus error pointer
g) Restore Stack pointer
h) Enable interrupts
i) Go back to user mode

The estructure of your code must be:

Steps a-e
jump to "Y"
"X": Here goes your bus error handler. Your don't need to restore
stack pointer and things like that. All you need is to save
your top of memory
Falling throught
"Y": Steps f-i

This system is used in TOS.

BTW, STE chipset doesn't give Bus error when you access to an addr
beyond physical end of the memory. It just wrap.

I think your best choice might be to have a look to TOS reset code. It's
very lightning.

Let me know your progresses. Good luck.

From: Brian Hutchinson <hutch@ena-east.ericsson.se>
Message-ID: <32ECFB2F.167EB0E7@ena-east.ericsson.se>
Source record: 7573

I recently purchased Devpac 3 for the Falcon 030.
I think the version is 3.10 (I don't have it in front
of me at the moment).

Does anyone know if this is the latest version or if
I need to get some updates from somewhere. I think I
remember seeing some files on UMICH that were about Devpac.

I also bought Devpak DSP for the 56k. Do I need anything
else to write code for 56k?

Thanks again,

Brian

gmiller@inca.co.nz (Gaven Miller) said:-

>Is there a specific reason that the GEM AES/VDI call interface was
>implemented differently to the GEMODS/BIOS/XBIOS call interface?

I can think of three possibilities, and they all reinforce each other
so it seems reasonable to me ... ;-)

Firstly, some Gem calls pass a lot of variables so there's less stack
overhead with arrays.

Secondly, you have the possibility for the calling code to just change
the array addresses between calls - could end up faster than
repeatedly stacking and unstacking lots of data which has not changed.

Thirdly and probably the most important, the interface is pretty
flexible. Atari used traps, maybe the PC used another calling method
like a fixed address (a complete guess there), and if Gem had taken
off bigtime then a "stackless" machine wouldn't have any problems
either.

>And, is there a better call-level interface that could be implemented?

Dunno. A linea type interface _might_ be more efficient. It depends on
the calling code really - and how tricky it would be to hook into it!

4527. SCSI on Falcon, how to program?

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-27 00:00:00 UTC
From: ljord@connectum.skurup.se
Message-ID: <5cj12v$rhn@Steinlager.tip.net>
Source record: 7576

```
Hi,

I'm trying to make contact with the SCSI-port
on my Falcon. This little program bombs out
with two bombs, why?
I'm using the data-adress that the Profibuch
tells about the TT.

I have used Lattice C ver 5.something.

//scsi.c
//To make contact with the scsi-port
#include <stdio.h>

unsigned char GetData()
{
char string[64];

printf("Please input 8-bit value (0-255): ");
gets(string);
return((unsigned char)atoi(string));
}

void WriteData(unsigned char val)
{
//I have tried 0xff8781 with the same result
unsigned char *data=(unsigned char *)0xffff8781;
*data=val;
}

unsigned char ReadData(void)
{
unsigned char *data=(unsigned char *)0xffff8781;
return(*data);
}

void ShowData()
{
printf("Value in scsi-data: %d.\n",ReadData());
}

void main()
{
long super=gemdos(32,0L);

if (gemdos(32,1)!=-1) {
printf("Not in Supervisormode.\n");
```

```
return;
}

ShowData();
WriteData(GetData());
ShowData();

gemdos(32,super);
}
```

>Truly one of the worst protocols I've ever seen.

Luckily all these problems only exist in AES 4.1. Other AES versions (e.g.
N.AES, Geneva...) don't have these problems. In those cases you can iconify
a window without the user having clicked on the smaller, and slots are only
reserved when the window actually is iconified.

I am not sure about Pure C 1.1, I don't have that, but in Pure C 1.0, you can define your own GemDOS/XBIOS calls by using one of the following low level builtin function calls: gemdos(), bios() or xbios(). With these, you can define any calls you want.

>help me in this matter.

It quite easy actually but relatively more difficult than using a line by line
output like printf(). Basically, you will need to know the location or
coordinates of where you want to draw. So there briefly what you do:
1/ decide where to draw in xy coordinates.
2/ decide what you are going to draw - text, box etc.
3/ use one of the many vdi drawing rountines to draw it - depending
on what you want to draw
eg in drawing text, you will pass the following items to the function:
x, y locations and the text to draw.

Sorry but I cannot remember the functions name...
(I mix up my Atari & VC++ functions calls anyway).

Not true. Atari post-documented a way to iconfy a window "by code". IIRC it
was wind_set(win, WF_FULLXYWH(?), -1, -1, -1, -1);

> Also, many applications don't support iconify all, so if someone
> control + clicks on the smaller a slot gets reserved, but no
> icon appears. The slot will be empty until you reboot.
That's a bug in Atari's MultiTOS. Clever(er) implementations (like the ones
found in N.AES or MagiC) don't create such empty slots.

Ciao

Thomas

Hello everyone,

Have you ever heard of Glasnost? It is a game programming language that I
am currently developing. It is freeware. For more info, visit

http://www.lysator.liu.se/~kilsmo/glasnost.html

There is now a Glasnost Mailing List:

Address: game_lang@lysator.liu.se

To subscribe, send an e-mail to game_lang-request@lysator.liu.se, with
subscribe as subject.

To unsubscribe, send an e-mail to game_lang-request@lysator.liu.se, with
unsubscribe as subject.

Subscription is not automatic, so it may take a little while until you are
on the list (maximum 24 hours). You will get an e-mail that confirms that
you are on the list.

Any questions, mail to kilsmo@lysator.liu.se

Nicklas Larsson

try to get the freeware VDI-Enhancer (enhancer.zip?) by Behne+Behne (NVDI),
which enables VDI to use offscreen-bitmaps (without buying NVDI).
It oftens come with the game "`Ballerburg"&#65533; and has an nice doku, wich
describes, how you can make use of "`extended"&#65533; VDI calls, which enhancer.prg
provides. This mechanism works for every other enhancement (if you have one
;-)

Hope it helps,

Martin

I appreciate that this wasn't your fault, Barry, but Geoff was just pointing out, albeit a bit sarcastically, that users of c.s.acorn.p, c.s.amiga.p c.s.apple2.p and c.s.atari.p are not neccesarily the most appropriate people to answer questions about M$ programming languages. Indeed, most of us frequent these groups because we want to have as little as possible to do with M$ specific programming.

Chris.

> doesn't take up much RAM.

And what if it was launched after the multitasker had started?

For example, if it is run via an "INIT=MAKEJAR 300" line in MINT.CNF?
(I've known some people to do such things, even though the apps placed
into INIT= lines can often be monotasked before MiNT).

And that the processor is given to another task quickly thereafter, before
it has had time to fully initialise?

Messing with the basepage will prve fatal if the OS has stored important
info there before the task switch when it tries to switch back.

(Yes, I know that GENEVA is a co-operative multitasker, and wont switch
away until you give it permission to (via an evnt_???? call)

It sounds as if you're causing a double bus fault; this happens
because; are you sure "Retry Failing Access" doesn't have
negative sense? The other thing you should check is that your
return address on the stack (and equally your status register)
are correct. If the stack pointer were to point to the wrong
place, you would almost certainly double fault the CPU - and on
almost all CPUs, a double bus fault puts the processor into a
sort of halt mode, where it doesn't even bother trying to execute
instructions.

4545. GEMulator FAQ in the making

Newsgroup: comp.sys.atari.programmer
Date: 1997-01-29 00:00:00 UTC
From: cronos@worldaccess.nl
Message-ID: <N.012997.111700.14@wxs4-8.worldaccess.nl>
Source record: 7594

Hi there, and sorry for the cross-posting...

GEMulator is an Atari ST emulator for PCs. The creation of a newsgroup is in the making, although limited to a planning stage at the moment. I am currently setting up a FAQ file, and I would like to request everyone who has fixed any of the problems he ran into to write them down (including their solutions) and mail me at my private email address. It looks like the first version of the FAQ will primarily be questions (so you're welcome to ask questions that you don't know the answers to, too), but I'm sure we'll get there in the end.
If you want to be put on the GEMulator FAQ mailing list, please email me with a subject of "sub GEMulator FAQ list".

If you want to have a look at some of the problems *I* am having with the GEMulator...

1) "ST Zip" won't work. It cannot write (deflate) anything; it gets write errors on the hard disk. Can this be fixed?

2) Can "FastCopy Pro" be made to work? I tried to copy a disk (this had readable directories and folders) and, although FCopy appeared to work fine (albeit slow when writing) the target disk had 0 bytes used, and no folders either.

3) "Revenge Doc Displayer" refuses to be installed properly. How come?

4) "Freedom" seems not to work; the file selector seems unable to let you save a document that already exists, although it does update the time stamp.

5) "Xboot" sees folders double and can't find its own "c:\XBOOT\" path. Suggestions?

6) "Ledpanel" doesn't work.

7) I tried installing Geneva and Neodesk 4 on the GEMulator. Neo4 seems to work just fine. Installing Geneva goes fairly OK, but it can't use Neo4 at the same time. I think the problem is the following: To autoboot Neo4 from Geneva (as a shell), Geneva has to read the specs from GEM.CNF. And the GEM.CNF is always 0 bytes after installing it on GEMulator...

8) The GfA Basic compiler "MENU.PRG" screws up compiling. I fixed this problem...a solution will be in the FAQ.

9) A failsafe way to check the write-protect status (on any Atari, any TOS version) won't work on GEMulator. How can one check this now?

That's it...I hope there'll be lots of response.

Gary Priest <gary@the-gap.demon.co.uk> wrote:
>Does anyone out there have any details on how to call and use the Brainstorm
>JPEG Decoder?

Well, the actual documentation for that decoder is not freely available.
I got some 'reverse engineered' code from a guy here on Usenet (can't
remember his name) some time ago, though, which I have improved a bit and
am using in the latest MGIF beta versions. This code certainly does not
know about everything that JPEGD can do and it might not be as stable as
it could be. Still, it has loaded all JPEGs I've tested it with just fine
in both 24 bit and greyscale mode.

If you're interested, I'll see if I can find the code somewhere (I'm already
looking since someone asked for the same thing on one of the German groups
only a few days ago). My Falcon is dead so I can't access the MGIF sources
directly, but I'm sure I have floppy somewhere...

The first thing that comes to mind is that the system has entered an infinite
loop.

> [...]
> ; ST RAM bus error handler -
> ; A4 has failing address on entry
> ; sets d6 to error address
> ..fix_phystop ; ST RAM bus error handler
> movem.l a1/a2/a3/a5,-(sp)

> lea 16+2(sp),a3 ; address in stack to fix before returning
^^^^
Where did you get this value from? I can't remember off-hand what order the
CPU puts the SR and PC onto the stack but at anyrate this number should be
negative. Remember:

ds.b 1024
stack: ds.b 1

The stack goes down memory not up it.

> rte ; return from exception

Because you have put the new address into the wrong place, rte will return to
the point where the exception took place...

> ..tol1 tst.l (a4) ; test ram address - BUS ERROR
> possible! add.l d4,a4 ; increment pointer
> bra.s .tol1 ; loop

Causing this to loop and generate another bus error, rte then sends you back
to this position which then generates another bus error, and so on. Voila
your infinite loop.

Jr,

Thanks for your response.

The code sets the RTE return address to be the first instruction _after_ the
loop - to the label ".l1ret" (loop 1 return)

> > [...]
> > ; ST RAM bus error handler -
> > ; A4 has failing address on entry
> > ; sets d6 to error address
> > ..fix_phystop ; ST RAM bus error handler

> ^^^^
> Where did you get this value from? I can't remember off-hand what order the
> CPU puts the SR and PC onto the stack but at anyrate this number should be
> negative. Remember:

16 = 16 bytes of registers saved on stack.
2 = return address is two bytes beyond registers in exception frame.

memory looks like this at entry to the bus error handler:

(on a 68010 or better CPU)

sp + 0 (saved a1)
sp + 4 (saved a2)
sp + 8 (saved a3)
sp + 12 (saved a5)
sp + 16 saved SR
sp + 18 return address
sp + 22 stack frame format (available on all exceptions from 68010+)
sp + 24 (exception data as generated by CPU)

(on my system [68030 CPU] the format word contains the value $B008,
signifying exception vector offset was $008 (ie vector 2 - bus error), and
stack frame type B (bus error, long format)
```

The 16+2 points at the return address to be "corrected" before the RTE.

On a 68000, the return address is another 8 bytes further on in the stack frame (at offset sp+26).

I set it up for a 68010+, and then a few lines later check the CPU. If it is an 010 or above, I skip the next line (which increments a3 to point to the stacked return address for a 68000).

The stack and everything else (CPU determination, for one), was set up around 500 lines before the code snippet in the usenet article.

If I was to do as you suggest, and use a negative offset from the stack, it would (1) be overwritten by the single step Trace-Trap handler the debugger uses, (2) be writing into unknown space, not related to the bus error exception frame.

> ds.b 1024

> your infinite loop.

The address to return to is ".l1ret", which was saved into a2 before the memory test code started, and before the first bus error.

This was put into the stack frame at the correct offset (according to my docs) by my bus error handler.

-(10,000 pictures of beautiful hot sexy Celebrities CD-ROM - ME#3)-
Questions? CALL US IN USA 1-757-686-1271 - 6 CD-ROMS in ONE!

Check this out:

600+ pictures of Cindy Crawford
400+ pics of Pamela Anderson
250+ pics of Elle Macpherson
200+ pics of Christina Applegate
200+ pics of Alicia Silverstone -==< 10,000 CELEBRITIES!! >==-
200+ pics of Mariah Carey
200+ pics of Sandra Bullock
150+ pics of Liv Tyler, young star
130+ pics of Niki Taylor
130+ pics of Kate Moss!!! For a list of ALL files on the CD
100+ pics of Madchen Amick
100+ pics of Racquel Darrian - *WOW*
80+ pics of hot model Jenny McCarthy! (Nudity!)
80+ pics of Paulina Poriskova, sexy supermodel!
70+ pics of Bridget Hall, supermodel!
50+ pics of TRACI LORDS, yes! ***6 Celeb CDs in One!***
50+ pics of Daisy Fuentes, hot spanish VJ
50+ pics of Salma Hayek, sexy latina actress! order now
50+ pics of Teri Hatcher 1-757-686-1271
* 4000+ pics of other NUDE stars
* 4000+ pics of PG-13 rated celebrity poses
* 10,000+ pictures total, thats TEN thousand!
* Graphics viewing software for Windows3.1/DOS/Win95
* CD is BBS ready, with descriptions of files! And its Mac readable!
* Many more features and pictures of stars!
* NO AMATURE MODELS! - ONLY Celebs!

(Orders call 757-686-1271)

Other information:
* Packed in white shipper: No signs of nudity (Wife protection plan!)
* There are over 10,000, that's TEN THOUSAND FILES, on ME#3 alone!
* All pictures are high quality at least 640x480!
* Directories are arranged in NUDE/NON NUDE format for easy use!
* Graphics viewing software for Windows/DOS/Win95
* CD Is ISO-9660 Macintosh compatible if you have a Mac JPG viewer

* It's truly BBS-ready with detailed descriptions of all files!
* ME#3 will save you -ALOT- of download/searching TIME & MONEY!
* Sysops! Has a files.bbs conversion program for different formats!
* Many more features.. Guaranteed or your money back!

This CD represents high quality work. Here is the pricing:
$$$ $36 each (plus $2 shipping, $5 shipping outside USA) $$$

(*) Call 757-686-1271 to order via credit card over the phone!

Qualifications: You must be OVER 18 & live somewhere on planet EARTH!
Please remember, Foreign orders add $5 for shipping instead of $2

We have the following Pentium Computer for sale.

Manufactuer: Canon

Specification:

Pentium 133 CPU
1.6 Gig Hard Drive
1.44 Floppy Drive
8X CD-Rom
28.8 Bps Modem
16MB of EDO Ram 72 Pin
Mid Tower with open 3 open 5.25 bays and 1 3.5 open bay
Case also has RF Connector
Intel Chipset Motherboard
16 bit Sound Card
1 MB PCI VGA Exp. to 2 MB
256k Pipeline Cache
PS/2 Keyboad and PS/2 Mouse
Windows 95

All computers are brand new from Manufactuer.

Price: $ 1,099 USD

Optional:

2 X 4 CD Recorder (Internal)
w/SCSI Card, EZ CD Pro Software
Price: 399.95 USD

Expand to 2MB of VGA Graphics
Price: $ 49 USD

Monitors Avilable Upon Request

If you have any questions feel free to call,
Please leave a message and your call will be returned promptly.

> > to this position which then generates another bus error, and so on. Voila
> > your infinite loop.

There's another likely cause... it's called a double bus fault, and
is triggered when a bus error occurs inside your bus error handler;
on almost all CPUs, causes the CPU to go into a halt state. This
means that it's not even trying to run instructions any more, and
will not do so until reset.

> The address to return to is ".l1ret", which was saved into a2 before the
> memory test code started, and before the first bus error.
>
> This was put into the stack frame at the correct offset (according to my
> docs) by my bus error handler.

Are you absolutely certain that you're not either returning to the wrong
address, or corrupting a register that you're using in the bus error
handler as a pointer?

All you have to do is trigger another bus error, and you'll kill your
system stone cold.

-----BEGIN PGP SIGNED MESSAGE-----

I'm reposting this here on behalf of Colin Fisher-McAllum, SysOp
of 42 BBS, as he hasn't quite mastered his usenet stuff yet.

Point of note: before anyone asks - yes, Daron does know that
this is being posted. In fact, he specifically requested that
Colin post something to let everyone know what was going on, and
why the NeST BBS network would be down.

Please don't email either Colin or I about this: everything
either of us knows is contained within this message.

I also urge all of you to think before posting any replies.
Remember that judicial laws state that someone is innocent until
proven guilty - Daron is a well-respected member of the Atari
community, and idle speculation would only harm his reputation.

Original from Colin Fisher-McAllum follows:

================================================================
====
I am sorry to say that until other arrangements can be made,
NeST is
closed.

Daron Brewood was raided this morning and all his equipment
impounded
subject to an investigation into computer pornography.

Regards

Colin

If you want to do SCSI programming, try downloading the CBHD harddisk
driver. It provides an SCSI programming interface.
It should be on ftp://ftp.cnam.fr/pub/Atari/Disk/

From: gryf@hrzpub.th-darmstadt.de
Message-ID: <5d49en$ui9@rs18.hrz.th-darmstadt.de>
Source record: 7715

Hi!

In article <5ckndv$ioo@rs18.hrz.th-darmstadt.de>, I wrote:
> Not true. Atari post-documented a way to iconfy a window "by code". IIRC it
> was wind_set(win, WF_FULLXYWH(?), -1, -1, -1, -1);
OK, here's the correct way to do it (thanks to Thomas Much who sent this
correction to me):

-- cut here --
Create a window (or if it's open, call wind_close()),
make a wind_set(handle,WF_ICONIFY,-1,-1,-1,-1) and a
wind_open(handle,-1,-1,-1,-1) call. There you are.

appl_getinfo() tells you if you can use iconification at all.
-- cut here --

Hope that helps ...

Ciao

Thomas

>iconify a window"?

Eg. when the user selects under the 'windows' menu 'iconify' the
application is able to iconify its own windows.

>>Also, many applications don't support iconify all, so if someone
>>control + clicks on the smaller a slot gets reserved, but no

>that don't support the iconifcation, right? I've never seen it on, say,
>my Prospero C editor. But I do agree that it would be nice if you could
>iconify applications that don't explicity handle iconification.

Annius means ICONIFY ALL which is sent when you click on the smaller
icon holding control. This should cause the application to appear to
iconify all its windows down into one icon. Try it. Desktop likes it,
and some programs like it, but others (eg Thing?) will ignore the
WM_ALLICONIFY message which will cause AES 4.1 problems (but not N.AES)

For starters, it wipes out all of the cookies already in the jar.
If it crashes the system, that at least would teach you not to run
it on a system which doesn't need it.

4574. GEM questions

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-04 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <247cd$16a2.68@HERMES>
Source record: 7721

I am trying to write a 3D object plug-in for my Toolbox TSR.

This plug-in is to be responsible for redrawing and handling 3D objects on screen.

In order to redraw objects, a separate VDI virtual workstation handle is required. To open a virtual workstation, one needs the system workstation handle, which can be retrieved via the AES call graf_handle.

But the AES isn't available until all the AUTO folder programs have been enumerated and have run to completion (either Pterm, Pterm0 or Ptermres).

So, how do I open a VDI workstation from within the AUTO folder? And, if so, can I leave it open through a Ptermres() call? (So I can use the stored handle in my VDI redraw routines in the plug-in as called from the main app)

I believe thet I can use v_opnwk and open a full workstation, but that will then prevent GEM from using v_opnwk when it [GEM] starts.

At present, the plug-in requires the calling app to call an intialisation function, passing in a pointer to a buffer containing AES version (if it is over 3.3 and we are in a 16+ colour screen mode then 3D effects are applied, otherwise not) and the system VDI handle. On return from the init function, the rest of the buffer is filled in with pointers to callback functions in the plug-in to be used for redrawing (ie within a G_PROGDEF object)

And, of course, when the prog exits, it has to call a de-initialisation function within the plug-in.

But, this feels like a bit too much work. Is there a way to check AES version and open a workstation when the plug-in is being loaded at boot time?

The X servers for Mint are mono-only. If you want colour X on your Atari,
you'll have to go with Linux or NetBSD.

What do you mean by "oldfashioned Freemint"? The FreeMint releases are
more recent than Mint 1.12, and from my experience, are remarkably
stable. X should be able to run on top of them with no problems (I
usually run AES 4.1).

4579. AES Messages

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-05 00:00:00 UTC
From: lvzon@bio.vu.nl
Message-ID: <5d9pfn$2m3@balaena.bio.vu.nl>
Source record: 7726

GEM Messages are enough to drive one completely mad...

Anyway, I have a little problem which I hope someone can shed some light on...

In a program I am writing I'm using a loop to check the mouse status, among other things. It looks something like this:

```
do {
<stuff>

event = evnt_multi( MU_MESAG || MU_M1, ... , 0, <workarea>, ...,
msgbuf, .... , mousex, mousey, mouseb, ..);

if (event && MU_MESAG) {

switch (msgbuf[0]) {
case WM_REDRAW:
<do stuff>
break;
}
}

} while (!mouseb);
```

The MU_M1 part serves two purposes: it keeps the loop running and it checks whether the mouse is still in the work area. It seems to work fine.
The MU_MESAG bit however, is acting a bit strange.
When it gets a redraw message in this loop it keeps repeating the message until some other message appears... When the loop starts I get message nr. 8 (what is it?), which is repeated until I get a WM_REDRAW, which is then repeated until I get some other message..
What's going on? I've tried about anything to figure it out, rangeing from clearing vars to comenting out pieces of code.

Anyone?

Thanks...

The following bit of code is more what you seek as all the event
handling is done in one while statement:-
```

```
int main()
{
/* initialise program */

m1flag = 0; /*-- wait for mouse to enter rectangle ---*/
timlo = 0; /*--- timer values ---*/
timhi = 255;
done=0; /*--- done flag set to 1 by QUIT or ^Q---*/

while(!done)
{
/*--- the main loop of the application ---*/

happened = evnt_multi(MU_KEYBD|MU_MESAG|MU_M1|MU_TIMER|MU_BUTTON,
1, /* number of clicks to wait
for */
1, /* mouse buttons bmask */
1, /* bstate */
m1flag, /* mouse pointer */
tidex,
tidey,
tidew,
tideh,
0, /* m2flag */
0, 0, 0, 0,
msg, /* message buffer */
timlo, timhi,
&mousex, &mousey,
&button,
&shiftkey,
&keycode,
&clicked);

/*--- which event? ---*/
if(happened & MU_KEYBD)
{
do_keyboard(shiftkey,keycode);
}

if(happened & MU_BUTTON)
{
do_button(mousex, mousey, button);
}

if(happened & MU_M1)
{
do_tidemouse(mousex,mousey);
}

if(happened & MU_M2)
{
/* do nothing in this case */
}
```

```
if(happened & MU_MESAG)
{
do_message(msg);
}

if(happened & MU_TIMER)
{
/* do nothing in this case */
}

} /* end of while(!done) */

/* clean up here */

return EXIT_SUCCESS;
}
```

Hi all.

I hope someone can help me out with a weird problem concerning AES
messages.

The scenario is that keyboard shortcuts are picked up by evnt_multi()
and passed to a function for checking. If they are valid, a message is
sent via appl_write() to the AES to say that that menu item has been
selected and from then on the program behaves as if it really had.

Or it did in the last version of the program. In the new version I am
currently working on all keyboard shortcuts have stopped working.
What's really strange about this is that, since they worked perfectly
before, I haven't touched this part of the code.

Tracing the thing through, I can tell you that the key scan codes are
picked up correctly and passed on. The correct menu item is selected
and the message is assembled correctly and appears to be sent OK.
However, after passing through evnt_multi() it has changed radically.
For example, pipe[0], which was MN_SELECTED (13) has changed to 0.
Anybody got any idea what is going on here and how I can counteract it?

Regards
Martyn

In addition to the other typo noted previously, there is one here, too. That line should be MU_MESAG | MU_M1. As it's written above, you will effectively only ever end up with MU_MESAG events.

lvzon@bio.vu.nl (Levien van Zon) said:-

>GEM Messages are enough to drive one completely mad...

You might want to investigate putting evnt_multi() into a structure
and use Evnt_Multi() instead. Apart from keeping everything nicely
together and thus more readable, it also allows you take advatage of
using defaults which means no silly crashes ...

```
#ifndef EVM_H
#define EVM_H EVM_H
typedef struct {
int16 evm_event; /* required events */
int16 evm_clicks; /* required number of clicks (usually 1) */
int16 evm_button; /* required button (1==left,2==right) */
int16 evm_bstate; /* required state (0==up,1==down) */
int16 evm_m1io; /* 0 == into, 1 == outof, (default into) */
Rect evm_m1; /* default, all set to 1 */
int16 evm_m2io; /* default outof */
Rect evm_m2; /* default, all set to 1 */
int16 *evm_msg; /* message buffer */
uint32 evm_time; /* timer value */
int16 evm_mousex; /* mouse xpos on exit */
int16 evm_mousey; /* mouse ypos on exit */
uint16 evm_mbutton; /* mouse buttons on exit */
uint16 evm_kstate; /* ie shift ctrl keys etc */
uint16 evm_keycode; /* scancode and ascii code */
int16 evm_clicked; /* mouse clicked this many times on exit */
} EVM;
#endif /* EVM_H */
```

Er, Rect is defined as:

```
typedef struct {
int16 x,y,w,h;
} Rect;
```

The Evnt_Multi() function could be defined as ...

```
#include "evm.h"
uint16
Evnt_Multi(m,init_flg,msgbuf)
EVM *m;
BOOL init_flg;
int16 *msgbuf;
```

```
{
if (init_flg) {/* some reasonable defaults */
m->evm_event = MU_MESAG;
m->evm_clicks = 2;
m->evm_button = 1;
m->evm_bstate = 3;
m->evm_m1io = 0;
m->evm_m1.x = m->evm_m1.y = m->evm_m1.w = m->evm_m1.h = 1;
m->evm_m2io = 1;
m->evm_m2.x = m->evm_m2.y = m->evm_m2.w = m->evm_m2.h = 1;
m->evm_msg = msgbuf;
m->evm_time = 0;

return 0;
}

if (!m->evm_msg) {
form_alert(1,"[3][ Evnt_Multi() | Not initialised ][ Fatal ]");
return 0;
}

return evnt_multi(
m->evm_event,
m->evm_clicks, m->evm_button, m->evm_bstate,
m->evm_m1io, m->evm_m1, m->evm_m2io, m->evm_m2,
m->evm_msg,
(uint16)(m->evm_time & 0xffff), (uint16)(m->evm_time >> 16),
&m->evm_mousex, &m->evm_mousey, &m->evm_mbutton,
&m->evm_kstate, &m->evm_keycode,
&m->evm_clicked
)
;
}
```

.. and in use you would do something like this ...

```
static EVM evm;
main()
{uint16 events;
int16 msg[8];
BOOL done =FALSE;

appl_init();
Evnt_Multi(&evm,TRUE,msg);
evm.evm_event |= (MU_M1 | MU_BUTTON | MU_TIMER);
evm.evm_time = 1000;

while (!done) {
events = Evnt_Multi(&evm,FALSE);
if (events & MU_MESAG) Hndl_MESAG();
if (events & MU_M1) Hndl_M1();
if (events & MU_BUTTON) done = true;
```

```
if (events & MU_TIMER) Hndl_TIMER();
/* ... */
}

/* ... */
}
```

Believe me, it's well worth implementing something like this!

Maybe the message pipe has overflowed?

It might be better to post the code as it could be something as simple
as a memory leak.

4587. AV_Protocol - how to get Environment AVSERVER

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-06 00:00:00 UTC
From: rojewski@primenet.com
Message-ID: <5dctbt$s9q@nnrp1.news.primenet.com>
Source record: 7595

I have two AV_PROTOCOL documents, one specifies finding the name of the AVSERVER environment variable. Is shel_write(8...) the way to get this, or a simpler way.

Also, how can I test this using single-TOS (4.04). If seems like I need Magic or MultiTos to check it out.

Thanks in advance,
John

peek($fffffc02) gives the scancode of the last pressed key. You have to read the adress in Supervisor mode, in Gfa it's called speek() if I remember right, numbers 0<x<128 are scancodes for pressed keys, the same code + 128 is the realease code for the same key. Warning: when the mouse of a joystick is active a special mouse or joystick packet is send to the same adress, you can't distinguis between mouse or joystick packed data.
But ehh... doesn't inkey$ the job?

Bye, Hans Wessels

Bconin()

>> I know that the Atari ST has double debouncing so it would only be
>able to return the scan code for the last key that was pressed, but that
>will be fine.
>> I can call a function to return a value for the shift, control, etc..
>keys without any problems using one of the XBIOS routines. I would like a
>similar function for the other keys.

Rather than use Kbshift() - get Bconin() to return the shift bitmask
in bits 24..31 by toggling bit 3 of conterm (byte at location $484).
This saves them getting out of sync.

>> I have tried using other XBIOS routines relating to keyboard
>detection, but they all seem to use a keyboard buffer. This means that it
>returns the last key that was pressed, and not necessarily the key that is
>being pressed at the time.

Avoid this problem by disabling keyboard repeats - clear bit 1 of
conterm to do this. Just in case the buffer has chars in it before you
start, flush it via WHILE (Bconstat(BC_CON)) DO Bconin(BC_CON);

>> I need to be able to tell if a key is being pressed or not being
>pressed at the time the function is called.

Having done the above initialisation the test is simple ...

IF (Bconstat(BC_CON)) THEN key = Bconin(BC_CON);

.. the asci code is in the low byte of the low word of 'key'. The
scan code is in the low byte of the high word, and the Kbshift() bits
are in the high byte of the high word.

>> I managed to find a memory location (521 bytes after the keyboard
>buffer, I think) on my 2meg STE that does the trick: When a key is down
>the memory location hold the scancode for that key. When no key is down
>the memory location holds a null byte.
>> I can call a function to check the value in this memory location, and

>therefore detect which key is being pressed, if at all.
>> This memory location varies for different TOS versions and different
>machines!

oo-er! ;-)

>> I believe there must be a command in BIOS, XBIOS or GEMDOS (or
>something else) that will allow me to detect a keypress without using a
>keyboard buffer or repeat/delay rates etc..
>> ..or there may be some way of finding out where the memory location
>(holding the scancode) is for the machine that the program is running on.

It would be a lot of work to get access at a lower level - keyboard
processor interrupts, buffers and suchlike.

> I program using GFA basic, but I should be able to call BIOS commands
>that other languages use. If anyone could help me I would be very
>grateful. Thankyou.

There is another alternative - use the VDI. I had the urge to go see
how difficult it would be and was pleasantly surprised to find it was
trivial, especially considering I've never used the VDI input calls
before! ...

```
#define DEF_VDI
#define DEF_VSF_INT
#include <gem.h>

main()
{int wki[11] ={1,1,1,1,1,1,1,1,1,1,2},
wko[57],
vh;
Rect nowt;
int xy[4];
uint k;

appl_init();
vh = graf_handle(PRECT(nowt));
v_opnvwk(wki,&vh,wko);

/* completely pointless red box ... */
vsf_interior(vh,VSF_INT_PATTERN);
vsf_style(vh,4);
vsf_perimeter(vh,TRUE);
vsf_color(vh,RED);
v_hide_c(vh);
xy[0] = xy[1] = 0;
xy[2] = wko[0];
xy[3] = wko[1];
v_bar(vh,xy);
v_show_c(vh,TRUE);
```

```
/* the relevent bit ... */
/* enter sample mode ie dont wait for input - return immediately */
vsin_mode(vh,3,2);
do {
printf("\033H\033K"); /* yep, lets mix console and graphics! */

/* if keypress print scancode and ascii code */
if (vsm_choice(vh,&k)) printf("0006",k);
/* shift etc test [vq_key_s()?] omitted */

printf("\n"); /* easier than fflush(stdout) <G> */
evnt_timer(100,0); /* so we get a chance to see printf()! */
}while ((k & 0xff) != 13);
/* ... end of relevent bit */

v_clsvwk(vh);
appl_exit();
exit(0);
}
```

> time?

No. To put it simply.

In more complicated but less subtle phraseology: No.

To rephrase another way; No.

Basically, you can't do it. AND DON'T EVEN THINK ABOUT OPENING
A PHYSICAL WORKSTATION YOURSELF; YOU'LL CAUSE ALL SORTS OF
PROBLEMS (most likely, anyway).

Do it just the way you are doing it at the moment, and you'll be
fine. OK - so it's complicated, but have you ever programmed
Windows(TM)(R)(whatever other letters are after it at the moment)?
Windows is *really* complicated. And when I say *really*, I
mean *REALLY*. ;->

Of course we need it.

As we all know, Atari programmers are really Windows PC programmers.

And, of course, the name of this newsgroup ("comp.sys.atari.programmer")
is just another Microsoft secret invention (shortly after Bill Gates
created the Internet) for housing the best Windows programmers and keeping
them away from the know-nothing rabble - like Microsoft programmers.

... Now you're ready for the actual shopping. Your goal should be to
get it over with as quickly as possible, because the longer you stay in
the mall, the longer your children will have to listen to holiday songs
on the mall public-address system, and many of these songs can damage
children emotionally. For example: "Frosty the Snowman" is about a
snowman who befriends some children, plays with them until they learn
to love him, then melts. And "Rudolph the Red-Nosed Reindeer" is about
a young reindeer who, because of a physical deformity, is treated as an
outcast by the other reindeer. Then along comes good, old Santa. Does
he ignore the deformity? Does he look past Rudolph's nose and respect
Rudolph for the sensitive reindeer he is underneath? No. Santa asks
Rudolph to guide his sleigh, as if Rudolph were nothing more than some
kind of headlight with legs and a tail. So unless you want your
children exposed to this kind of insensitivity, you should shop
quickly.

4601. HELP: Keypress detection!

Date: 1997-02-06 00:00:00 UTC
From: D.E.Jones@ex.ac.uk
Message-ID: <D.E.Jones-0602971135410001@144.173.2.230>
Source record: 7740

Hi all,
I am a keen programmer and I am having a problem with detecting keypresses. This is what I would like to be able to do:

- Call a function that will return the scan code of any key that is pressed down at the time.

> I know that the Atari ST has double debouncing so it would only be able to return the scan code for the last key that was pressed, but that will be fine.
> I can call a function to return a value for the shift, control, etc.. keys without any problems using one of the XBIOS routines. I would like a similar function for the other keys.
> I have tried using other XBIOS routines relating to keyboard detection, but they all seem to use a keyboard buffer. This means that it returns the last key that was pressed, and not necessarily the key that is being pressed at the time.
> I need to be able to tell if a key is being pressed or not being pressed at the time the function is called.
> I managed to find a memory location (521 bytes after the keyboard buffer, I think) on my 2meg STE that does the trick: When a key is down the memory location hold the scancode for that key. When no key is down the memory location holds a null byte.
> I can call a function to check the value in this memory location, and therefore detect which key is being pressed, if at all.
> This memory location varies for different TOS versions and different machines!
> I believe there must be a command in BIOS, XBIOS or GEMDOS (or something else) that will allow me to detect a keypress without using a keyboard buffer or repeat/delay rates etc..
> ..or there may be some way of finding out where the memory location (holding the scancode) is for the machine that the program is running on.

I program using GFA basic, but I should be able to call BIOS commands that other languages use. If anyone could help me I would be very grateful. Thankyou.

Dan Jones.

Is there a way to have an extended file system on my ATARI MEGA2 TOS102(such as THIS.EXAM.PLE instead of THISEXAM.PLE)

Yup, Get mint with minix or magic with VFAT.
That will work. bye :)
However the desktop from thr ROM can not display the longfilename
correctly.
You woudl need an alternative desktop.
However Magic comes (I believe) with it's own desktop.

I'm not completely sure if VDI is available from within the AUTO folder,
but I guess so. You simply open a workstation (not a virtual one !) for
the screen, and you can draw using this handle. You must have closed it
again by the time the AUTO execution is finished, otherwise AES can't
open their screen workstation.

> so, can I leave it open through a Ptermres() call? (So I can use the

No, see above. There is not way to tell the AES to open a virtual,
instead of a 'real' workstation.

> stored handle in my VDI redraw routines in the plug-in as called from the
> main app)

Yes.

> function, the rest of the buffer is filled in with pointers to callback
> functions in the plug-in to be used for redrawing (ie within a G_PROGDEF
> object)

You can make your code be a Ptermres program, which only initialises the
most basic stuff, but not the VDI. Then make an accessory (better : a CPX
module) to call the init routine automagically after the AES have started.
I guess you'll need some user settable variables too, the accessory or CPX

is the perfect place to let the user enter them. The init routine then
opens a virtual workstation just like you're used to do.

> And, of course, when the prog exits, it has to call a de-initialisation
> function within the plug-in.

Not needed with a Ptermres solution, like the one I suggested.

Cheers Peter

Use MiNT and MINIX filesystem
it works very well for me on my ATARI ST, ATARI STE and FALCON.

Well, you could either get Magic which uses the Windows 95 VFAT filesystem (crap, crap, very crap) or you could get MiNT with Minix and have a proper filesystem which is very, very fast. Both offer long filenames. Magic costs money, whereas MiNT and Minix can be downloaded from any good Atari FTP site.

Cheers,

James Cox.

Are you into HOT CHAT? We've got the world's largest voice-personal dating system, as well as the hottest, sexiest "1 on 1", "2 on 1", and "PARTY-LINE" chat you'll find anywhere, all in one place! And you don't have to call a 900 number to get in on this hot phone fun!

You can choose from 5 hot programs that are sure to fulfill your every desire!

You can press 1 from the main menu to choose from our sexy "1 ON 1" PLEASURE MENU, then:
*to talk to a BEAUTIFUL SEXY GIRL, press 1.
*for a 1 on 1 session with an experienced DOMINANT MISTRESS, press 2.
*for steamy talk with a LUSCIOUS TRANSVESTITE, press 3.
*for an erotic 1 on 1 chat with an EXOTIC TRANSSEXUAL, press 4.

*for some man to man action with a HOT GUY, press 5.
You'll be billed just $3.99 per minute for your selection.

Or you can press 2 from the main menu to DOUBLE YOUR PLEASURE, then:
*to speak to 2 HOT SEXY GIRLS, press 1.
*to get it on with a swinging WILD COUPLE, press 2.
You'll be billed just $4.99 per minute for your selection.

Or you can press 3 from the main menu to join the GROUP ORGY LINE!
*You can party with the nations nastiest swingers for only $2.50 per minute.

Or you can press 4 from the main menu, then:
*Press 1 to join the FANTASY NETWORK. This is the world's only phone service that allows you to connect with people who share your personal fantasies. This state-of-the-art voice mail system lets you listen to messages from beautiful girls, sexy transvestites and she-males, gay and bisexual males, and dominant women. Leave them a hot and sexy message, then call back to see what erotic message they have left for you. You'll be billed just $3.50 per minute.
*Or press 2 to listen to a hot selection of recorded fantasies steamy enough to make you explode! Choose from beautiful, sexy women's fantasies or domination stories. You'll be billed just $2.49 per minute.

Or you can press 5 from the main menu for the HOT AND NASTY DATELINE, where you can listen, and respond, to voice personal ads from hot horny girls in your neighborhood, including their real names and home telephone numbers! You can also leave your own personal message for people to get in touch with you. Make new friends on the world's busiest voice personal lines! Meet singles or couples, gay or straight; you'll be billed only $2.99 per minute.

***JUST CALL 1-800-756-3906 to use your Mastercard, Visa, or American Express card. The charge is just $2.49-$4.99 per minute, plus a 50 cent connection fee. 18+ only.

***OR CALL 1-900-745-4398. The charge is just $2.49-$4.99 per minute. Must be 18 years of age or older.

Call now!!! YOU WON'T REGRET IT!

4615. What about a GIF DSP decoder?

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-09 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <5667018_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 7614

Here's an idea:

If anyone out there can code the DSP and has knowledge of GIFs, how about writing a GIF DSP decoder (along the same lines as the Brainstorm JPEG one, ie. a TSR).

This could then quickly become a standard (like the jpeg one) and I'm sure applications such as CAB and GemView etc. could be changed to support it!!

So, how about it anyone?

Regards, Gary

Thanks for your response.

I was referring to something loaded during the boot phase (ie from the
AUTO folder).

From what I am led to believe, GEM AES funcs like graf_handle are not
avaialable until after the AUTO folder has been scanned.

In the Auto-folder, it's no problem to open a physical workstation (but you
must close it on exit). Many boot selectors do so to allow the use of the
mouse.

Ciao

Excelent! I have been waiting for one of these for ages! :-)

>anyone tell eme where to get and overview and more indepth spec of the
>falcon audio?

I have example 680x0 and C code for playing samples on the Falcon using
the appropriate XBIOS calls on my WWW pages. I haven't detailed how to
do it directly accessing the hardware, but this is quite simple once you
know how the OS calls work (the hardware is the same thing - just not as
nice an interface, and quite a bit faster).

The programming pages are at:
http://www.cs.man.ac.uk/~jacquesa/programming/

I haven't (yet) got any info on MIDI, but I might add some (mail me if
you are interested in this).

> Also any advice on a good 68030 reference book. Cheers.

well, a good DSP book might be of more use... :)

4624. GTAR crashes with > 100MByte files - any ideas?

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-10 00:00:00 UTC
From: sig@end.article
Message-ID: <sig-1002971334010001@47.85.0.99>
Source record: 7623

Hi

I use a version of GNU Tar made by a guy called Alan Hourihane, because it works with the Tapebios package (also his). This version is Tar 1.10.

It worked really well, allowing me to backup files to a Tar archive, which was easily read by another computer..

Problem; if I attempt to backup more than (approx) 100 MBytes it crashes.

It causes a Bus Error, the PC has a value like 677A004E, which AIUI, is way above the addressing space of the 68000.

Does anybody know any reason why, like is there a maximum file size on the ST under TOS 1.04 ?

Is this a symptom of Stack underflow/overflow ?

The problem can't be the Tapebios driver, as I can create disk images of 250 Mbyte disks.

The crash happens under TOS or MiNT (1.12.6 or 1.14).

Machine is a 4 Mbyte STFM, TOS 1.04.

Does anyone know of a good 'postmortem' program that displays the registers etc. after a program has bombed ie. RAM $380 - $3EB!

It must work under MagiC.

TIA, Gary

That'd be BCF FORTRAN. I know people who've used it successfully for
some jobs, but I use Prospero. I wrote an article on the subject for ICTARI.

Get thee to:

http://www.elis.demon.co.uk/ictari/ictari.htm

And download issue 40, which also contains the BCF compiler. Issue 41 has
the GNU FORTRAN to C converter, which is also meant to have some limited
FORTRAN 90 support. I posted this earlier but Demon ate it...

Have Fun,
"Augeas"

>Here's an idea:
>
>If anyone out there can code the DSP and has knowledge of GIFs, how about
>writing a GIF DSP decoder (along the same lines as the Brainstorm JPEG one,

I've thought about this, but I very much doubt that there would be any
major performance advantage over a good CPU decoder. The DSP is not very
good at the bit manipulation you need to do when unpacking GIFs and then
there's the small memory to worry about.

>This could then quickly become a standard (like the jpeg one) and I'm sure

Even if the GIF decoder ran on the CPU it could of course use a similar
concept as Brainstorm's JPEG decoder. The reason noone has done this is
probably that a reasonably good GIF decoder is small and simple to write.
(Naturally, a really good one is not quite as simple to do. ;-)

>applications such as CAB and GemView etc. could be changed to support it!!

I think what we really should have is something similar to the Amiga's
'datatypes'. Any program that supports them can load any file type that
the user has a 'driver' for (if I've understood matters correctly).

>So, how about it anyone?

If there hadn't been the Unisys patent on the LZW algorithm (used in GIF)
to worry about, I might've done something with my code from MGIFv5 (I've
not seen a faster GIF decoder than the one in my latest v5.10beta), but
right now it looks like I'll have to disable GIF support in the next
release version... :-(

Perhaps there's some anonymous guy from a country where software patents
can't be filed who'd like to give it a try? ;-)

Can someone help? I am writing a new GEM-based VT100 telnet for stik. (a beta is about to be released.) I just found some bitmapped GDOS compatible fonts that have a full VT100 set, including the pseudo graphics chars. How do I load them into a program, without using GDOS or equivalent. I have nvdi 4.0, but want to write the prog. for all Ataris. The Lattice manual sorta impies that I need GDOS to load them, but I got these from an old program (circa 1988) that didn't use it. How do I do it without distributing some Gdos with the files???

>OK, here's the correct way to do it (thanks to Thomas Much who sent this
>correction to me):

<snip>

Thanks a lot! :)

A couple of minor points I discovered (yes it does work - it tried it last night).

* Geneva (005 demo run as a MiNT AES) doesn't support this, and it allocates an empty slot and looses the window. However, N.AES/AES 4.1 do support this. Iconify is broken in both XaAES and oAESis atm. so I didn't bother testing it with them. :)
* When you recieve the WF_UNICONIFY message, you will get -1,-1,-1,-1 as the position/size of the window, so you will need to have a way of restoring it to the correct position (put it in the wind_set(...WF_UNICONIFY...) call).

Does anyone know if it works under Magic? (it doesn't really matter, as magic doesn't even 'have' iconify, as it is < AES 4.0 and appl_getinfo shouldn't be available < 4.0 so you cannot check for its presence...)

Ehhh... what do you mean with this? MagiC does have iconify and appl_getinfo
should be available. Why its not truely AES 4.1 compatible and report
3.99 as AES version I don't realy understand either. It wouldn't cause to
much work to make it support AES 4.1 fully and it would make me happier.

Andreas Kromke should know.

Hmm - just wondering if I sent you some sources called LINEAX or
something similar. I certainly hope so because I've lost them and I
wonder if you still have them?

If you do look for a file called _lx_lfnt.c which contains all the
information on loading and processing a bitmapped gdos font.

I know I sent the source to somebody!

4639. Problem with events...

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-11 00:00:00 UTC
From: afoster@zetnet.co.uk
Message-ID: <5dqleq$vjn@irk.zetnet.co.uk>
Source record: 7638

Hello...

I'm writing a little clock program using SozobonX C, and I've come across a little problem. I've got the clock itself to work perfectly; the hands will move around the face and so on, but I can't get it to do so if I put it in a window and check for window events (movement, clicking on the close box etc). The evnt_mesag command seems to stop everything, until something happens, at which point the clock changes to the correct time.

Is there a way of checking for events without making the whole program come to a halt? I have put the offending piece of code below.

```
while (boolean){
time (&rawtime);
time_struct = localtime(&rawtime);
evnt_mesag(msg_buf); /* <---- The problem's here! */
switch (msg_buf[0]){
case WM_MOVED:
/* Lots of code here... */
break;
case WM_CLOSED:
quitflag = FALSE;
boolean = FALSE;
break;
}
if (time_struct->tm_sec != seconds){
boolean = FALSE;
}
```

Any ideas on how to fix this? I thought a tiny clock program would be easy to write, but I'm stuck, and I haven't even got on to the window clipping yet... :-(

Thanks for any help...

Adam Foster

> HEEELP!!!

From=20the premere issue of STart, pg 42:

---
The following technique will let you load and use alternate fonts without=
=20
using GDOS. Your font must be in the standard format (including header)=20
as defined in the VDI manual. Either compile the font into your=20
application, or load it from a file at run time.

Instead of doing the normal vst_load_fonts call, you will alter your=20
application's control array directly. Control words 7 and 8 must be a=20
32-bit pointer to the font. Control words 10 and 11 are a 32-bit pointer=20
to a scratch buffer which will be used by the VDI when doing special=20
effects such as bold or italics. Control word 9 must be set to the length=
=20
in words of this buffer. The buffer should be at least four times the=20
size of the largest character in the font.

After setting up the control array, you should be able to select the font=
=20
using the set_font function. When you are done with the font, or with=20
your program, do a regular vst_unload_fonts call so the VDI doesn't=20
continue to think the font is available.

(thanks to John Feagens of Atari for this information.)

Actually, I use the evnx_multi() call provided by Sozobon's XGemFast lib.
It uses a structure called XMULTI which includes GRECT structures for
rectangles, which is more or less what you described in your example.
I just didn't use evnx_multi() in my posting, because I gather that not
everyone is familiar with Sozobon C :-)

Yeah, I just recently saw the docs on the VFAT fs in some Linux Howto
file... Tjeez! It's a classic Crap Microsoft Backward-compatibility Patch!
It uses additional entries in the dir table which are sort of masked of from
the normal DOS fs to store additonal characters for the file name. That's
why W95 locks it's filesystems: to prevent properly written programs like
Disk Doctor from messing up (ie. fixing) the "crap" extra dir entries...
Unbelievable...

[code snipped]

Your program is (correctly) waiting for a message, use the evnt_multi
function with timer values set to 1 second.

Yeah. Use evnt_multi(...); specify several event types, including
WM_MOVED, WN_CLOSED and the one for a time delay. Use a time delay of
0. Remember that the event dispatcher will coalesce events if it can;
msg_buf[0] may contain several events |'red together.
When your code is called, if no other event occurs, you'll still get
your timer event immediately.

> available < 4.0 so you cannot check for its presence...)

According to my Compendium, AES >= 3.40 have appl_getinfo(); it's just
that
AES < 3.99 don't support modes above 4. But since you can inquire the
maximum
mode number that's supported, this isn't a problem. You should really
check
for AES >= 3.40, then ask which functions are supported. If the
functions
to test for iconification aren't supported, you don't have
iconification.
Otherwise you do. No messing around with checking for version 4.0 and
MagiC
separately.

MagiC supports iconification as of version 3, I think. The AES version
reported is always 3.99 for MagiC (or has been up to now, as far as I'm
aware).

> I _think_ windows uses a different method, but I never could figure it
> out.

Sadly, Windows uses absolute addressing; it relocates the addresses
when the program is loaded, based upon the current positions of the
various system DLL's in Windows' memory map.

Some Windows programs "dynamically" load the DLL's, and use pointers
to functions (obtained with GetProcAddress(), I think - but I'm not
sure; I don't program Windows much at the moment) to call the
functions within.

DOS and the BIOS do indeed use "INT" instructions.

The disadvantage of "INT"/"TRAP" instructions is that they generally
take longer to execute (e.g. on the 68000, "TRAP" takes ~40 cycles!).
Absolute jumps take relatively little time by comparison, and,
on the 68000 and on older Intel chips, don't switch into any
protected mode. On the newer Intel chips, it appears you can mess
around with the memory mapping so that the chip switches into
a higher protection mode when it calls a particular routine. This,
I presume, is how Windows protects itself.

afoster@zetnet.co.uk (Adam Foster) writes:
> Is there a way of checking for events without making the whole program
> come to a halt? I have put the offending piece of code below.
Use evnt_multi() and wait for message- and timer-events (i.e. MU_MESAG |
MU_TIMER). Use a reasonable short amount for the delay between two timer
events. But don't forget that this period is the _minimum_ delay, so it
might easily happen that the next timer event occurs much later, e.g. if
some other application has locked the system for some time in a cooperative
multitasking environment. Also note that if a message event occurs, the
next call to evnt_multi() will again wait for the full timer delay and
forget about the time spent in the last call to evnt_multi().

Ciao

Thomas

Where does one get this VDI manual? All I have a re the 'C' manuals
for MWC and for Lattice 'C' 5.6. The fonts turn out to be standard GDOS
type fonts with ID 50, and 21 different sizes and faces, including Greek like
the DEC supplemental font and the special graphics fonts.
1. HOW does one compile a font into an application?

>Instead of doing the normal vst_load_fonts call, you will alter your=20
>application's control array directly. Control words 7 and 8 must be a
>32-bit pointer to the font. Control words 10 and 11 are a 32-bit pointer

2. IF you load it at run time, where do you find these pointers, etc.?
Sorry to sound dense, but tho I have programmed for many years,
I am a novice at 'C', and "browsing" thru the manual to find the one needed
command from a non-intuitive name list is a bear, to say the least.

>to a scratch buffer which will be used by the VDI when doing special

```

You have to include MU_TIMER as well or it will just sit and wait, at the
place you have marked, for the above events to come and no others.
Add MU_TIMER to your program and it should work just fine.

For ST-high you need XVGA or SVGA monitor and to know how to connect this monitor to ST. For ST-med and ST-low you need special multisync monitor.

4662. Help, please! Atari400!

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-13 00:00:00 UTC
From: slothdelux@aol.com
Message-ID: <19970213210700.QAA05831@ladder01.news.aol.com>
Source record: 7511

Does anyone have any technical manuals or anything for the Atari400? I just bought one for five bucks, and I want to do some programming on it. I'd like to try it in assembler, but all of the books that I could find about that have been out of print for quite some time. I also need the specs for the hardware (power supply, i/o, etc.). Any help at all would be appreciated. Email SlothDelux@aol.com

4663. Dpathconf

Newsgroup: comp.sys.atari.programmer

From: msbaines@cix.compulink.co.uk
Message-ID: <E5K1Cw.6vx@cix.compulink.co.uk>
Source record: 7512

Is the MiNT function Dpathconf() available on any other OS, such as MagiC, or
is it MultiTOS only?

In other words, can you have a drive U:? I see from someone with MagiCPC that
there is a U: drive but is it like MiNT's U:?
Does Pdomain(), Dopendir(), Dreaddir() mean anything under MagiC?

Thanks

Slainte mhath

I think it came with the infamous Developers Kit... I'm guessing this is th=
e=20
same thing as a standard GDOS bitmap font...

> 1. HOW does one compile a font into an application?

I'd like to know too... In C I think this involves converting a binary=20
file to hex codes which are placed into a static array...
=20
> >Instead of doing the normal vst_load_fonts call, you will alter your=3D2=

I am also a beginning C programmer. I think it has something to do with=20
v_opnvwk(). In my program it looks like this:

void init()
{
=09WORD work_in[11]=3D{1,1,1,1,1,1,1,1,1,1,2},work_out[57];
[snip]
=09v_opnvwk(work_in,&vdihndl,work_out);
[snip]
}

I think work_in[] is what your looking for. ProGEM (the only tutorial=20
I've read...) doesn't explain v_opnvwk() at all, what exactly are=20
work_in[] and work_out[]??? As you can see they are just local variables=20
```

that are ignored and obliterated once the init() code is finished...

Why don't you print or save this info in case you need it in the future?

Hello Friends,
It's time to take full advantage of the online medium by having your photographs scanned today! Once your pictures are scanned into one of three formats (GIF, JPEG, or BMP) you can do many exciting things with them.

-You'll easily be able to attach them to emails and send them to people your chatting with online. No more having to try and explain what you look like!

-You can also use your photos in all kinds of fun projects: build web pages; design your own greeting cards; make personalized stationary,desktops, and screen savers- the list is endless!

- Scan pictures of yourself, your pet, your vacation, or whatever you choose!

Cyber Services will scan ANY photograph, drawing, magazine clipping, or other artwork to an image file, and email or US mail it (on disk) back to you within 24 hours of its receipt. (You must be able to receive file attachments to get your file(s) via email. Check with your ISP if your not sure.) PRIVACY & CONFIDENTIALITY ARE ASSURED. You'll also receive helpful technical tips on everything from renaming your file to saving time when sending it to people via email.

We scan all our images in 16.7 million colors for best quality. For just $1 extra we can enlarge or crop your photo, blur out a body part, or ad text (such as your name or email address).

Best of all, as a FREE GIFT to you (limited time only), IF YOU CHOOSE TO, we'll reserve you a FREE PAGE (or pages) in our "Internet Date-Site" (Now under construction!!!). This web site contains pages classified by local area and sexual preference. There's also a erotic image gallery (must be legal age to enter), and a "special interests" section. That's right, you can have your own page on the internet for just $4! (Note: You're responsible for answering your dog's email!) Your free page(s) will include any or all of the following: Your scanned photo(s) (You pick which ones- You can have some, none or all of your photos posted on your page), your email address with an icon visitors can click to send you mail, and a brief profile about you. We'll remove or modify your page, at your request, at anytime! When the "Date-Site" opens for business, you'll receive an email notifying you of the address of your personal web page. You can give the address to people and they can view it from any internet
connection! There are millions and millions of people on the internet.It's

time you start meeting them! (This service won't be free for long so act now!)

If you have any questions regarding our services, please call us at (541)744-5718.

Ordering Information:

Price: $4 for first scan, $3 for each additional scan
Extras: $1 each to add personalized information. (name/email)
$1 each to have image modified (enlarged, body part blurred, etc..)
$2 to have image files mailed to you on a floppy disk (IBM or MAC).
$1 credit card processing fee (Visa/Mastercard users only)

If you would like your photographs returned to you please include a self addressed stamped envelope. Otherwise they will be destroyed.

Order Form (PRINT OUT or COPY CLEARLY):

Name (optional):

Email Address or Screen name (PRINT CLEARLY! You must be able to receive file attachments. Otherwise include $2 for shipment on floppy disk.):

Address (optional unless having shipped on disk):

Phone number (optional):

File type (GIF, JPEG, or BMP. GIF recommended):

Extras (Exact personalized info you want printed on scan):

Disk Format (if having mailed on a floppy): IBM or MAC

Payment method (Cash, Check, Money Order, or Visa/Mastercard):
Please make checks payable to Cyber Services.

Credit Card # (credit card orders only):

Expiration date:
Don't forget to include the $1 processing fee if your paying with your credit card.

Do you want the FREE GIFT? Yes or No (circle one)
-Web Page(s) in our "Internet Date-Site" (under construction). You can have a page for yourself, a page for your car, and a page for your cat! Be sure to indicate where you want your page (F4M, M4F, F4F, F4M, or Couples) and which of the following info you want on your page (print clearly): State and Town, email address, year or birth, physical description, quote/message (under 30 words please). Please indicate which photos you want on your page (if any) if you don't want them all to be displayed. If your want your nude/erotic photos displayed in our erotic image gallery YOU MUST include a signed statement that your are over 18 years of age or older and give us

consent to display your nude/erotic photo, and be sure to tell us if your want it displayed with your info or anonymously.

Mail the above information and photos with payment to:

Cyber Services
2852 Willamette St. #131
Department 1
Eugene, OR 97405

Orders sent overnight will be given first priority.

Erotic/Nude photo's will be accepted providing everyone in them is of legal age.

Questions? Call (541)744-5718

Please help our small business grow by sharing this info with someone you think could use it.

Thank You!

(xrCHpW)

b > load them into a program, without using GDOS or equivalent.

Refer to the Compendium (Appendix C) for the file format. The fonts
will be stored as a raster image 1 character high and 256 characters
wide, with a table of horizontal offsets to each character. You can
copy them to the screen using vrt_cpyfm().

Source record: 7520

The reason the DSP is good at decoding JPEGs is that JPEGs use a
cosine transform. Not only is the DSP good at multiply-and-add type
operations, it has a sine/cosine table already in ROM.

... and when the user CTRL-clicks the name instead of the one above/below it?

This will kill the accessory under MTOS, and will leave any app with
callbacks pointing into the accessory in a state of readiness to crash.

In a moment of weakness (and curiosity) some years ago, I picked up a copy
of Petzold's book "Programming Windows 3,1". After reading it, I was
amazed at the level of complexity an app has to go through to do anything.

I am still going to therapy sessions twice weekly to "normalise" myself. {[:-)]

Or, when not unnecessarily base64'ed [why not tidy your sigblock?],
>Just wondering what happens if I call appl_init() and gl_apid comes
>back -1? Can this happen? What does it mean?

What is supposed to happen - with the C bindings anyway - is that you
call appl_init(), and get a short int back, with -1 meaning failure.
However: the bindings supplied with the original Atari developer's kit
were supposedly defective; appl_init() returned garbage, but it did
initialise a global short int gl_apid to the return value. [See the
Tim Oren GEM tutorials.] If it happens, what it means is that the AES
can't allocate itself some resources to run a GEM app. I've never seen
this.

>
>According to my Compendium, AES >= 3.40 have appl_getinfo(); it's just that
>AES < 3.99 don't support modes above 4.

Well you must have a different edition of the AC. In the copy I have it says
appl_getinfo is present from AES 4.00 and modes above 4 are only supported
on AES >= 4.1 (which makes sense as AES 4.0 doesn't have iconify etc.).
This is also confirmed by my copy of Modern Atari System Software which
says that appl_getinfo is available from AES 4.0 (and doesn't mention AES
4.1 at all, and doesn't mention modes above 4)

I didn't get a chance to check my compendium CD, but I expect this gives the
same.

>But since you can inquire the maximum

>Otherwise you do. No messing around with checking for version 4.0 and
>MagiC separately.

Um, well as mentioned above you DONT have appl_getinfo (acording to Atari
Compendium and MASS) < 4.0 so you STILL cannot test without the dirty
hack (sorry, but it is...)

> check
> for AES >= 3.40, then ask which functions are supported.
The way I use to check for appl_getinfo() is the following:

```
if ((aes_version >= 0x340) || (appl_find("AGI?") >= 0))
{
< use appl_getinfo() with any mode and respect the return value - 0
means that the requested information is not available, 1 means OK >
}
```

Note that "AGI?" in the appl_find() is _not_ filled up to 8 characters, so
even if there was an application running with that name, it wouldn't be
found by that call. I don't know whether MagiC supports that "AGI?"-thing,
but at least WINX does, as it implements some appl_getinfo()-modes (but not
all, so it's _important_ to check for the return value of all calls to
appl_getinfo(), no matter what information was requested).

Ciao

Hi!

In article <E5K1Cw.6vx@cix.compulink.co.uk>,
msbaines@cix.compulink.co.uk ("Mark Baines") writes:
> In other words, can you have a drive U:? I see from someone with MagiCPC that
> there is a U: drive but is it like MiNT's U:?
> Does Pdomain(), Dopendir(), Dreaddir() mean anything under MagiC?
It does. But why bother? Just use the calls and check the return value.
GEMDOS has the nice (and documented) feature to return -32L (EINVFN) for
calls which are not supported by the current version.

And btw: The presence of Dopendir() & Co. does not automatically mean that
there's a drive U (and vice versa). For example, there are some MetaDOS
ISO9960-drivers which support these calls, even though there's no drive U in
the system.

But you may rely on the fact that if there's a drive U in the system (use
Dsetdrv(Dgetdrv()) and check bit 20 of the result), it will act mostly
"MiNT-compatible", e.g. that there are subdirectories dev and proc.

Ciao

Callum Baird Lerwick <lerwick@freenet.msp.mn.us> writes:
> Just wondering what happens if I call appl_init() and gl_apid comes
> back -1? Can this happen? What does it mean?
This means that the call has failed, e.g. because the system doesn't allow
another GEM application or has memory shortage. Always check the return
value of appl_init() and quit your app (_not_ using form_alert()) if it's
less than zero.

Or did you mean appl_init() has returned a value >= 0, but the value of the
app-ID in the global-field is -1? This would be a bug, either in the library
you're using, or in the OS.

And please, next time use a newsreader which is able to post US-ASCII as
US-ASCII, and not BASE64. I was lucky that my newsreader automatically
decodes that, but that does not mean that it's an allowed form of posting
text to the usenet ...

>Add MU_TIMER to your program and it should work just fine.

BTW, in order to "include MU_TIMER" you would have to change the evnt_mesag
to evnt_multi.

Alternatively, split your program into two threads; one which handles
events and one which does the ongoing processing.

This has the advantage of letting the kernal do the multitasking, which
should make the multitasking smoother, and you don't have to bother
with splitting the process up into slices yourself.

The disadvantage is that not all versions of TOS support multithreading, so
if you want your program to be backwardly compatible you would have to
implement both options.

Hi, the acc I just did can not be loaded correctly.
With all the aes it works fine, except the AES 4.1
The result is just blank. The acc is not in the menu bar, BUT! in the
processes it shows that it has been loaded, but just in state "STOP".
If I cont this process, then it will show up normally.
What do I need to implement in my program to load it up correctly with
mint/aes4.1?
this problem only appears with this aes version. Even with naes it
does the same, and I believe Naes is considered as 4.1 as well.
any help/tip would be appreciated.
Bye

>[snip]
>}
>
>I think work_in[] is what your looking for. ProGEM (the only tutorial=20
>I've read...) doesn't explain v_opnvwk() at all, what exactly are=20
>work_in[] and work_out[]??? As you can see they are just local variables=20
>that are ignored and obliterated once the init() code is finished...

work_in[] is supposed to allow some defaults to be set up when you
open the workstation simply to save you having to perform specific
initialisation calls.

work_in[0] Device Number
1 Line Type
2 Line Colour
3 Marker Type
4 Marker Colour
5 Text Face
6 Text Colour
7 Fill Type
8 Fill Style
9 Fill Colour
10 Co-ordinate System.

This mechanism is broken on early Gems thus you always pass the values
you have listed above because at best other values are ignored and at
worst it can crash the system. ie you are forced to use vdi calls to
set up alternatives. Not a problem - just slightly annoying.

The work_out[] array is filled by v_opnvwk() with values which tell
you about the virtual device you have opened. I'm not about to type in
the info about all 57 of them - perhaps someone else already has it in
a file?

It does not matter that the arrays are local. Each successful
v_opnvwk() [non zero return value iirc] allocates yet another
internal virtual workstation structure. The work_in[] contents are
copied into this and other settings are copied to work_out[] before it

returns. You are perfectly at liberty to trash both arrays after the call. vq_extnd() can be used to obtain the same 57 words or the "extended" words (yet more info). Some of the information is very useful and some of it is useless - it depends on the task in hand.

4685. Compression source code?

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-15 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <2f7cd$1732a.3e7@HERMES>
Source record: 7534

Where can I locate compression source code? ie ZIP or LZH.

I want to create a plugin for my Toolbox TSR that can handle compression on a system-wide basis.

So, one would be able to place the following functions in your code, and have them resolve to appropriate code within the compression extension (Toolbox plug-in):

```
archandle = arcCreate( "foo.archive" );
arcAddFile( archandle, "bar.file" );
arcExtractFile( archandle, "blat.file" );
arcCompressBlock( srcptr, src_size, destptr, dest_size );
arcExpandBlock( srcptr, src_size, destptr, dest_size );
arcDeleteFile( archandle, "redundant.file" );
arcCloseFile( archandle );
```

... as well as any I may have forgotten.

(An immediate use for this code would be in my DESKFMT background disc formatter/copier for MultiTOS. One could compress disc images as written by it and stored on the hard drive)

4686. Adding a new XBIOS function

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-15 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <2f7cd$1710d.1f2@HERMES>
Source record: 7535

As I have found out, some debuggers tend to pop up with an error message when one uses an illegal opcode, like TRAP #0 (which I use to call my Toolbox TSR or one of it's plug-in extensions)

MON, as supplied with Lattice C and Devpac 3.1 is a prime example.

Unless I write a daemon to set the trap vector to the right address, MON will pop up with "invalid Trap" every time I use it to debug an app which uses the Toolbox)

So, in the interests of making it more universal, I was thinking I'd patch into the XBIOS vector, and add a new XBIOS function which will resolve to the Toolbox code.

Is there any info as to what function numbers are available beyond those already defined? Or can I just simply add function numbers willy-nilly and include documentation to say "Function number XYXX is used to ..."

I am currently looking at function code 'tb' (0x7462, 29794) or 'TB' (0x5442, 21570) to call the Toolbox from the XBIOS vector.

Any ideas, guidelines, comments?

4687. ST Timers

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-15 00:00:00 UTC
From: cavey@cavestar.demon.co.uk
Message-ID: <856022434.20350.0@cavestar.demon.co.uk>
Source record: 7536

I am writing a MIDI sequencer and so would like to record incoming MIDI information to an accuracy of about 5ms.

I know that this could be done with the 200Hz clock at $4bc, but I'm not sure this would be accurate since there is the possibility of overflow occuring.

I have tried hooking into Timer C without much success, as my routine always crashes after it has run. Does anyone know about the functions of the timers, including information about the data registers? The Lattice C books don't go into enough detail.

TIA,

Mark

4688. Using the ST timers

AF> Is there a way of checking for events without making the whole
AF> program come to a halt? I have put the offending piece of code

As I see it, you should use the evnt_timer. With this event you will get an event at the specified time intervall. Each time you call you function that updates the display of the clock.

Good luck.

Yours sincerely

No, unfortunatly, you would have to 'roll your own' interface to it.

Since the programming docs are good, maybe it's posssible.

>According to my Compendium, AES >= 3.40 have appl_getinfo(); it's just
TAC is wrong here. appl_getinfo is only available from AES 4.00. The first 4
types are available only. Types 4-14 are only available from AES 4.10.
However, Magic has an AES of 3.99 and it is available there, so you do need
to check for the presence of MagiC apart from AES version.

TAC gets this wrong in many places. On the whole where it refers to 3.40
substitute 4.00.

I have a whole list of TAC errors collated from around the UK which runs to
29K long.

There is a lot to be said about the MFP and the timers.
I really think you should try to get hold of an Atari reference manual,
like "Atari ST Internals" or the "Atari Compendium".

So what about writing one for PNG insteed? Sounds like a much better idea.
As PNG support isn't as well spread yet it would be a good thing and
people wouldn't need to make their own, they just use the PNGDSP.PRG
placed in their autofolder. :-)))

How to Copy protect a disk

My idea is to damage a sector/track of the disk, 78 79 something late
and not used,

Then my program at boot up reads in the tracks, this is sooo quick:)
if there is an error then ok, if no error then not the same disk, a
simple error that fcopy and any other decent copier would fix
automatically,

First..I dont know how to damage the disk ?

Second..Anyone else any ideas for copy protecting a disk ?

Cheers...!ynoT

Good idea, I'd forgotten about that.

>And btw: The presence of Dopendir() & Co. does not automatically mean that

Yep.

>But you may rely on the fact that if there's a drive U in the system (use
>Dsetdrv(Dgetdrv()) and check bit 20 of the result)
Yes, understood.
Thanks Thomas

4701. HELP!! VDI vs ALINE speeds?

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-17 00:00:00 UTC
From: bdc2@po.CWRU.Edu

its beta phase now.
I got the original sources from J. Baumgardner, for his
Telnet 1.00, or something before the final versiion.
I have extensively reworked and rewritten most of the code, except for the
STiKstuff and thw windows structure. To work out the new Esc code
sequence logic, I adapted t100, a plain vanilla source from umich,
which uses aline coding, and souped up vt52 commands to LOOK like a VT102.
That works fine as a dumb terminal thru a direct dial-in to my VAX at
the lab, which uses VT100 codes extensively.
The command codes and they keypad instructions now work (mostly)
properly in both the t100, and the new TELVT102, which goes thru STiK, to
a slip acct., then telnetted to the same VAX. The slip line is running 115200,
thru a 28.8 modem. The T100 goes thru a different direct line at 19.2 with
14.4.
NOW, the important part of the problem. I ran a few timing tests.
With TELVT102, I typed out a 70k file to the screen, using vro_cpyfm
to do the scrolling, at the end of each line received. It took about
4 min, or a transmission rate of about 300 cps. I removed the scrolling
at the <CR>'s scrolling only at the end of each packet, and the speed went
up to about 450 cps, taking about 2.6 min.
THEN I connected with my T100, which uses aline and emulartes
the vt100 commands with vt52 codes thru aline, and scrolling at the
end of each line, it only took 1:05 , or abou 1k cps.
Using the same line,I used Connect, which uses GEM-type windows
but MAY be written in machine code, at least parts an it took 35 secs
or about 2k cps.
I even use NVDI, which is supposed to speed up GEM,no?
Any ideas why vro_cpyfm is so d--n slow?? Is there somewhere I can
find some source to adapt that uses VDI more efficiently?
If you reply, remember I am a novice 'C' programmer, who
has almost no references other than the C manuals, and the K & R book.

1 Clear the disk with a magnet.
2 format the disk double sided, 9 sectors per track, 78 tracks
using fcopy or another formatter
3 change the number of sectors to 1440 in the bootsector (offset $13) and set
the Media descriptor to $f9 (offset $15) (that one might be
already set to $f9 by the fromatter)

> Second..Anyone else any ideas for copy protecting a disk ?

Learn assembly, read all about the FDC and the DMA unit and obfuscate a track.

Bye, Hans

4703. Wanted: GFA Basic Source code for Database example

I'd like to get some samples of GFA Basic (Version 2.0 or 3.5) source code if anyone out there has some good examples. I'm trying to learn GFA Basic some and learn better by studying and changing items in others source code. If anyone out there has some they are willing to share, it would be greatly appreciated. Thanks Mike

4704. MagiC 5 and memory protection

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-18 00:00:00 UTC

Hi,

I have heard and read different stories about MagiC and its
so called memory protection.

How is the true story? I have heard several people saying
that MagiC doesn't have any memory protection at all (which
looks to be the truth as it's easy to get "memory block
destroyed" and a reboot as only solution, while MiNT handles
this just fine) but they claim in the docs that they have.

So how is the story? Will MagiC ever get proper memory
protection, or does it already have it, but it just doesn't
work very well or not as it's supposed to?

Anyone?

What is this 'evnx_multi()'?

As far as I can tell, MagiC does not have proper memory protection. It's supposed to be improved in v5.04 but is certainly pretty bad in v5.03 (which I have). Proper memory protection can only be implemented on processors 68030 and above or 68020 with a co-processor. Since MagiC also runs on STs with 68000 CPUs, the only way to implement it properly is use the MinT method of having two versions of the executable, one that uses memory protection and one that doesn't. Currently, it doesn't do this, though there is no reason why it shouldn't be implemented in the future. One of the Black Scorpian programmers recently wrote a small program to test MagiC's memory protection. All it did was write to memory that didn't belong to it. Magic crashed.

Regards
Martyn

Write a fake sector checksum.
